MAYO CLINIC

Mayo Clinic Rheumatology Update

April 17-18, 2015

Sawgrass Marriot
Ponte Vedra Beach, Florida

Terms of Use

Disclaimer

This information is made available by Mayo Clinic for educational purposes only. The material is not medical advice and is not intended to represent the only, or best, methods or procedures appropriate for the medical situation discussed; rather is intended to present an approach, view, statement or opinion of the presenters that may be helpful or of interest to other practitioners.

Procedures, products or instrumentation systems used, discussed and/or demonstrated may be experimental and may not have yet received FDA approval.

No Warranties

You understand and agree that the content or information contained or provided herein is provided on an "as is" basis. Mayo Clinic College of Medicine does not make any express or implied warranties, representations or endorsements whatsoever (including without limitation warranties of title or non-infringement, or the implied warranties of merchantability or fitness for a particular purpose) with regard to the information, content or service provided herein. In addition, Mayo Clinic College of Medicine does not guarantee this product will be free from technological difficulties and you understand that you are responsible for implementing sufficient procedures and checkpoints to satisfy your particular system requirements for accuracy of data input and output.

Limitation of Liability

The use of this service is entirely at your own risk, and in no event shall Mayo Clinic be liable for any direct, indirect, incidental, consequential, special, exemplary, punitive, or any other monetary or other damages, fees, fines, penalties, or liabilities arising out of or relating in any way to content, information, or service provided herein.

User Agreements

By accepting these materials, you agree that you will not:

1. Transmit any communications or content of any type that may infringe or violate any rights of any party.
2. Use this course material for any purpose in violation of local, state, national or international laws.
3. Use this course material as a means to distribute advertising or other unsolicited material to any third party.
4. Use this course material in connection with any material that is unlawful, obscene, defamatory, threatening, harassing, abusive, slanderous, hateful or embarrassing to any other person or entity.

CME Activity Description

This two-day course provides internists and general practitioners with an up-to-date focus on rheumatologic disorders. This course aims to help participants gain a better understanding of how to recognize and diagnose common rheumatologic disorders, as well as identify which patients can be managed within their own practice and which need referral to a specialist. Residents and fellows will have the opportunity to participate by submitting original studies for poster presentations. This course is seeking to offer optional CME and self-assessment credits available online after the course.

CME Activity Objectives

Upon conclusion of this program, participants should be able to:
• Review basic clinical and therapeutic aspects of rheumatologic conditions
• Improve interpretation skills for common rheumatology laboratory testing
• Identify patients that can be managed in primary care practices and patients that need to be referred to rheumatology
Attendance at this Mayo course does not indicate nor guarantee competence or proficiency in the performance of any procedures which may be discussed or taught in this course.

Intended Audience

This course aims to educate primarily internists and general practitioners, but will be applicable to Rheumatologists, as well as allied health staff working in the afore mentioned areas.

Continuing Education Credit

Mayo Clinic College of Medicine is accredited by the Accreditation Council for Continuing Medical Education to provide continuing medical education for physicians.

Mayo Clinic College of Medicine designates this live activity for a maximum of 13.5 *AMA PRA Category 1 Credit(s)*™. Physicians should claim only the credit commensurate with the extent of their participation in the activity.

ACPE
This course is eligible for Accreditation Council for Pharmacy Education (ACPE) credits. The exact number of credits has yet to be determined. Additional CME and self-assessment credits toward Part 2 Maintenance of Certification will be offered.

AAFP
This Live activity, Rheumatology Update 2015, with a beginning date of 04/17/2015, has been reviewed and is acceptable for up to 14.50 Prescribed credit(s) by the American Academy of Family Physicians. Physicians should claim only the credit commensurate with the extent of their participation in the activity.

CME Record of Attendance

A Record of Attendance is provided to you during on-site registration. The Record of Attendance allows attendees to calculate their own credits of participation in the educational activity.

The total number of credits participants can earn per day is noted on the Record of Attendance. Below each day is a line to record the actual number of credits during which you participated in the educational

activity. It is recommended that you record your actual credits daily as you proceed through the CME activity.

Upon conclusion of the CME activity, please total the number of credits you have recorded on the top half of the form, sign it, and return it with your evaluation to the registration desk.

The bottom half of the form represents your Record of Attendance, which **you must retain** for your records. Please make sure the number of credits claimed in both sections coincide. No other documentation is provided to you after this CME activity. The Record of Attendance has replaced the certificate.

The Record of Attendance can be used for requesting credits in accordance with state licensing boards, specialty societies, or other professional associations.

CME Activity Evaluation

The overall CME activity evaluation will be emailed following the activity to the email address that was provided when you registered. The CME activity evaluation is brief and will only take a few minutes to complete.

Faculty evaluation forms were offered to a sampling of the registrants. Completed faculty evaluation forms should be returned to the registration desk at the conclusion of the CME activity. If you wish to participate in evaluating the faculty, please stop at the registration desk to inquire if extra evaluation forms are available.

Your feedback is very important to us and will be used for planning future programs, as well as identifying faculty strengths and opportunity for growth.

Syllabus and Internet Access

An electronic syllabus will be provided to all attendees. Participants are invited to bring their laptops to the meeting room(s). Due to copyright issues or revisions, some slides may be shown during a presentation, but not provided within the syllabus.

Recording Device Policy

No recording devices, audio or visual, may be used during Mayo Clinic College of Medicine CPD activities. Duplication, distribution, or excerpting of this program, without the express written permission of Mayo Clinic, is strictly prohibited.

All of the proceedings of this program, including the presentation of scientific papers, are intended for limited publication only, and all property rights in the material presented, including common-law copyright, are expressly reserved by the Faculty and/or Mayo Clinic. No statement of presentation made is to be regarded as dedicated to the public domain. Any sound reproduction, transcript or other use of the material presented at this CME activity without the permission of Mayo Clinic is prohibited to the full extent of common-law copyright in such material.

Electronic Devices

Please turn all electronic devices (cellular telephones, pagers, etc.) to silent mode. As a courtesy to the presenters and other participants, phone calls should be taken outside of the general session.

Faculty, Planning Committee and Provider Disclosure Summary

Mayo Clinic Rheumatology Update
April 17-18, 2015

As a provider accredited by ACCME, Mayo Clinic College of Medicine (Mayo School of CPD) must ensure balance, independence, objectivity and scientific rigor in its educational activities. Course Director(s), Planning Committee Members, Faculty, and all others who are in a position to control the content of this educational activity are required to disclose all relevant financial relationships with any commercial interest related to the subject matter of the educational activity. Safeguards against commercial bias have been put in place. Faculty also will disclose any off label and/or investigational use of pharmaceuticals or instruments discussed in their presentation. Disclosure of these relevant financial relationships will be published in activity materials so those participants in the activity may formulate their own judgments regarding the presentation.

Listed below are individuals with control of the content of this program who have disclosed…

Relevant financial relationship(s) with industry:

Name	Nature of Relationship	Company
John M. Davis, III, M.D.	Grant/ Research	Roche, Genentech, Pfizer
Leroy Griffing, M.D.	Grant/ Research	Bayer HealthCare

No relevant financial relationship(s) with industry:

Name	
Florentina Berianu, M.D.	Clement J. Michet, M.D.
Ronald Butendieck, M.D.	Kevin G. Moder, M.D.
Kenneth T, Calamia, M.D.	Thomas D. Rizzo, Jr., M.D.
Gurjit S. Kealey, M.D.	Jason Sluzevich, M.D.
Thomas G. Mason, M.D.	Benjamin Wang, M.D.
Lester Mertz, M.D.	Kenneth J. Warrington, M.D.

References to off-label and/or investigational usage(s) of pharmaceuticals or instruments in their presentation:

Name	Manufacturer/Provider	Product/Device
Kenneth T. Calamia, M.D.	Anti TNF agents	Multiple

Rheumatology Update

Return to Program Schedule

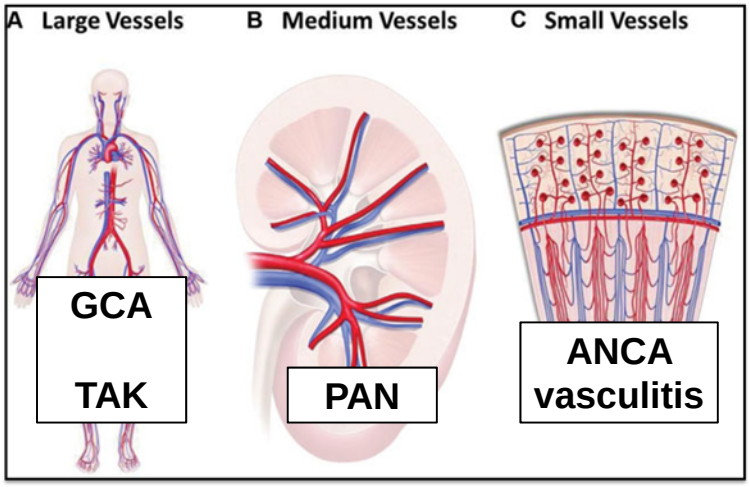
Objectives

- Describe vasculitis nomenclature and classification
- Discuss clinical features and cases pertaining to large, medium and small vessel vasculitis
- Explain treatment options

Vasculitis

- Group of diseases
  - Vascular inflammation
- Clinical features
  - Highly variable
- Multisystem disease
- Rapidly progressive organ dysfunction

2012 Revised International Chapel Hill Consensus Conference Nomenclature of Vasculitides



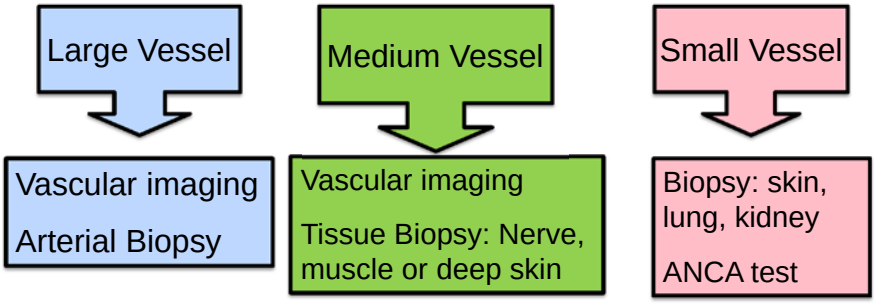
Arthritis & Rheumatism Vol. 65, No. 1, January 2013, pp 1–11

- Variable Vessel Vasculitis
  - Behçet's disease
- Single Organ Vasculitis
  - e.g. CNS vasculitis
- Vasculitis with Rheumatic Disease
  - e.g. RA, SLE
- Vasculitis associated with probable etiology
  - Hepatitis (B, C)
  - Drug-induced (Antibiotics, others)
  - Malignancy - heme

Arthritis & Rheumatism Vol. 65, No. 1, January 2013, pp 1–11

High Clinical Suspicion

Systemic Inflammatory Process



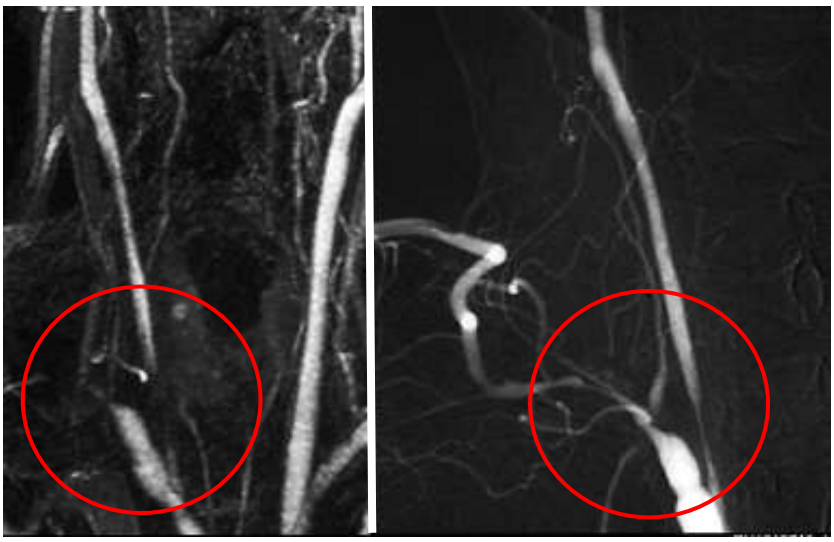
ANCA: Antineutrophil Cytoplasmic Antibodies

Case

- 29 year-old F; difficult to control HTN
- 6 months of malaise, myalgias and fatigue
- R upper extremity claudication
- Exam: BP 80/- mmHg R arm; 156/80 mmHg L arm
  - R radial pulse absent
  - R carotid and R subclavian bruit; abdominal bruit
- Lab: Hb 10.5 g/dl, ESR 22 mm/hr; CRP 12 mg/L.
  - Autoimmune serologies all negative

MRA

Angiogram



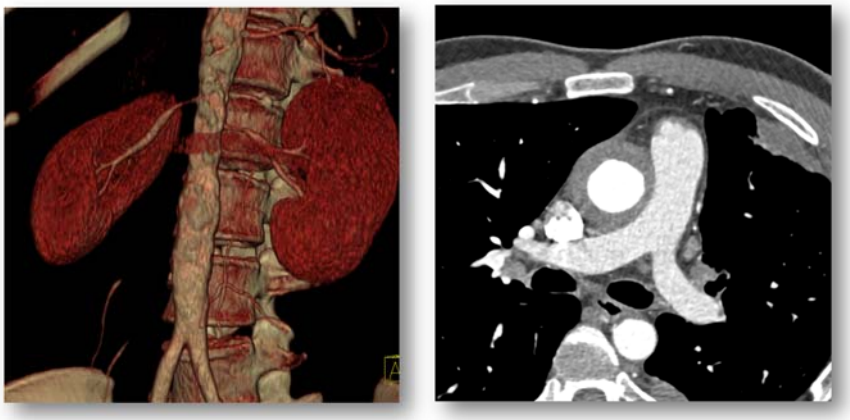
MAYO CLINIC

Takayasu Arteritis

- Women (80-90% of cases)
  - Young (< 40 yrs)
- Very rare: 1-2/million/yr
- No specific lab test
  - ESR, CRP *may be normal*
- Age at diagnosis: 31 years
- Delay in diagnosis: ~18 months
  - Imaging: MRA, CTA, PET

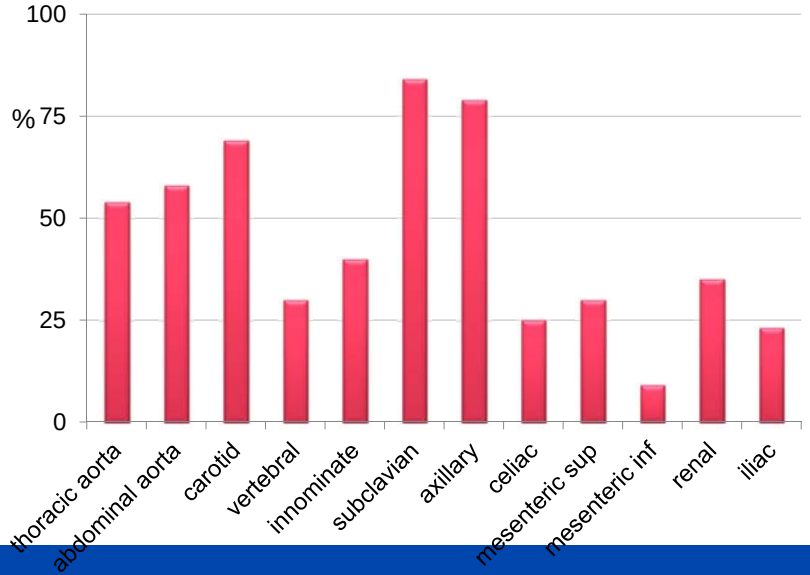
MAYO CLINIC

Takayasu Arteritis



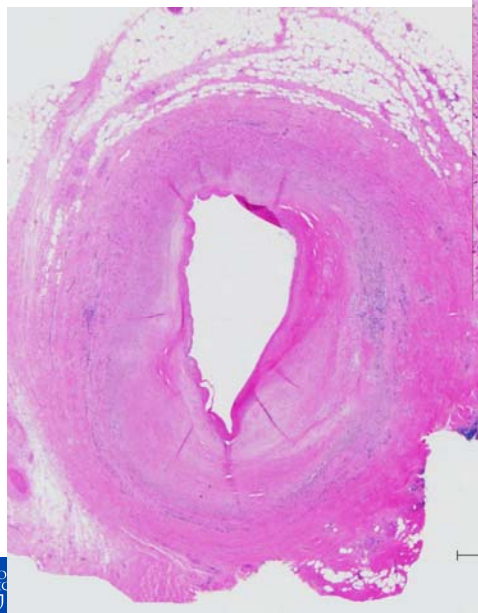
MAYO CLINIC

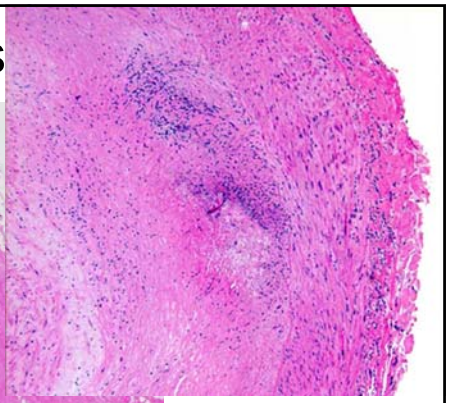
Imaging - Distribution of arterial involvement

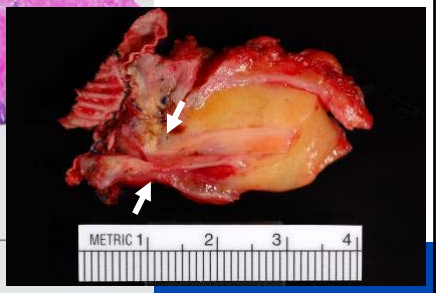


Mayo Clin Proc. 2013;88(8):822-830

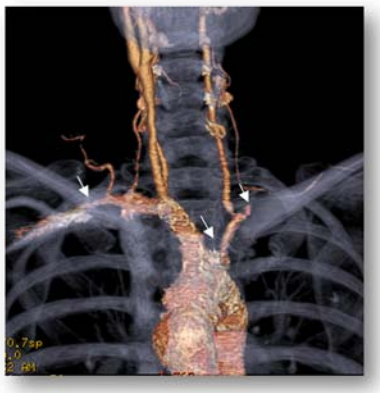
Coronary Vasculitis







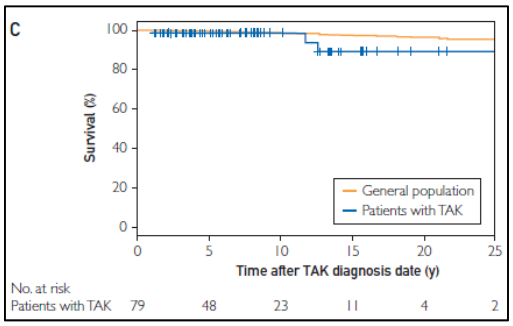
Takayasu Arteritis



- Assessment of disease activity
  - Challenging
  - Serial imaging essential
- Treatment
  - Steroids
  - Immunosuppressives: MTX, AZA, MMF
  - Refractory cases: TNF inhibitors
  - Vascular intervention

Takayasu Arteritis - Survival

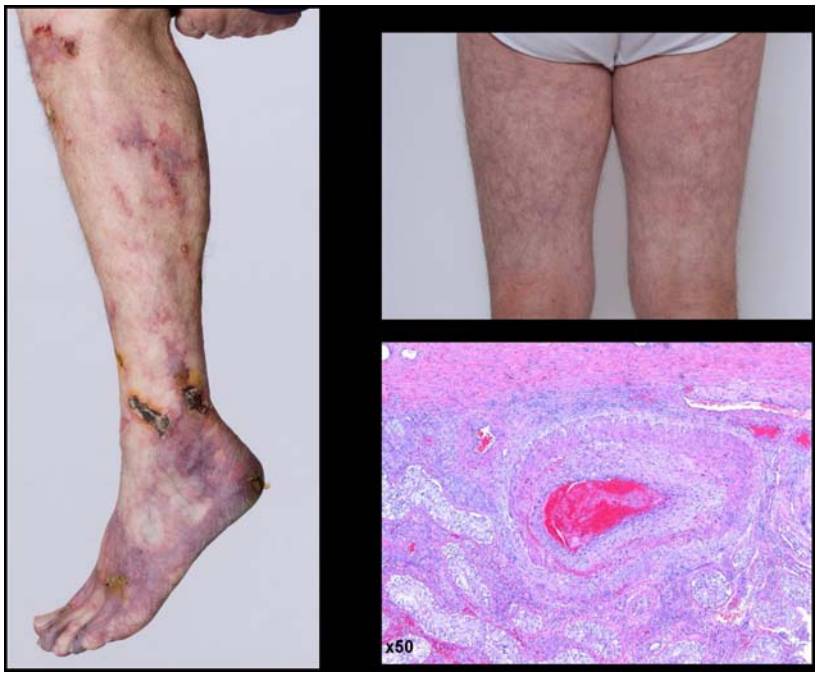
- 10 years – 97%
- 15 years – 86%
- Median age at death
  - 45.5 years
- SMR 3.0 (1-8.9)



Schmidt J et al. Mayo Clin Proc. 2013;88(8):822-830

Case

- 36 year-old male hx of iv drug use
- Constitutional symptoms
- Post-prandial abdominal pain; testicular pain & necrotic leg ulcers
- BP is 200/110 mmHg.
- ESR is 112 mm/hr
- Creat is 2.3 mg/dL. Urine: protein, no blood
- HBsAg is positive and viremia present

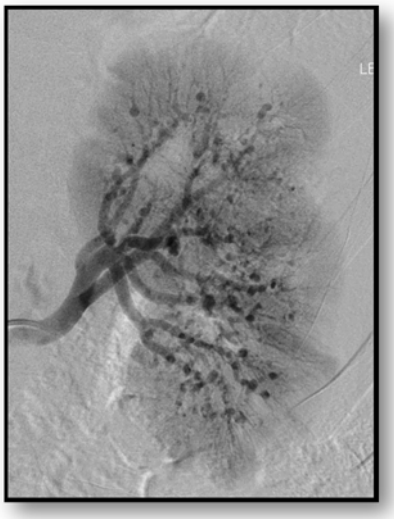


Polyarteritis Nodosa

- Vasculitis of medium-sized arteries
  - Rare: 5-10 / million / yr
  - Incidence declining
- More common in men
  - mainly age 40 to 60 years
- Associated conditions
  - Hepatitis B infection (third); HIV
  - Hematologic: Hairy cell leukemia
  - Medications: Minocycline

Watts RA, et al. Ann Rheum Dis 2001;60(12):1156-7.
Guillevin L, et al. Medicine (Baltimore) 2005;84(5):313-22.

PAN Diagnosis: Biopsy or Angiography



MAYO CLINIC

Classification Criteria (3/10)

1. HTN – new onset
2. Renal insufficiency
3. Mononeuritis multiplex/ polyneuropathy
4. Hepatitis B
5. Aneurysms or occlusions on angiogram
6. Biopsy – Vasculitis
7. Weight loss >4kg
8. Livedo reticularis
9. Testicular pain
10. Muscle weakness/myalgia

No Lung Involvement
No active urine sediment
No ANCA

MAYO CLINIC

Lightfoot RW et al. Arthritis Rheum. 1990 Aug;33(8):1088-93

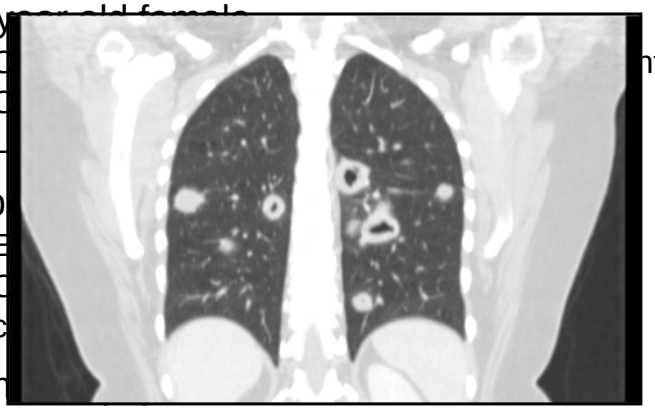
Polyarteritis Nodosa
Treatment

- Corticosteroids
  - Prednisone 1 mg/kg per day for 4 weeks with taper over 9 to 12 months
- Cyclophosphamide
  - Poor prognostic features: renal insufficiency, GI, cardiac or neuro involvement
- Hep-B associated PAN
  - Limit immunosuppression
  - Early use of anti-viral Rx

Guillevin L, et al. Arthritis Rheum 2003;49(1):93-100.

Case

- 25 y
  - C
  - C
  - L
- Lab
  - E
  - C
  - c
- Ren
  - Necrotizing glomerulonephritis, no immune-complexes



ANCA-associated Vasculitis

Granulomatosis with Polyangiitis

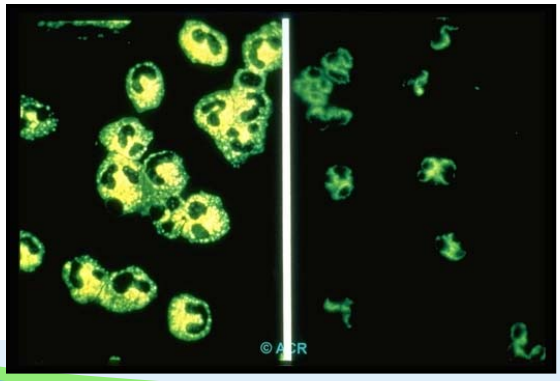
C-ANCA

Proteinase-3 (PR-3)

Microscopic Polyangiitis

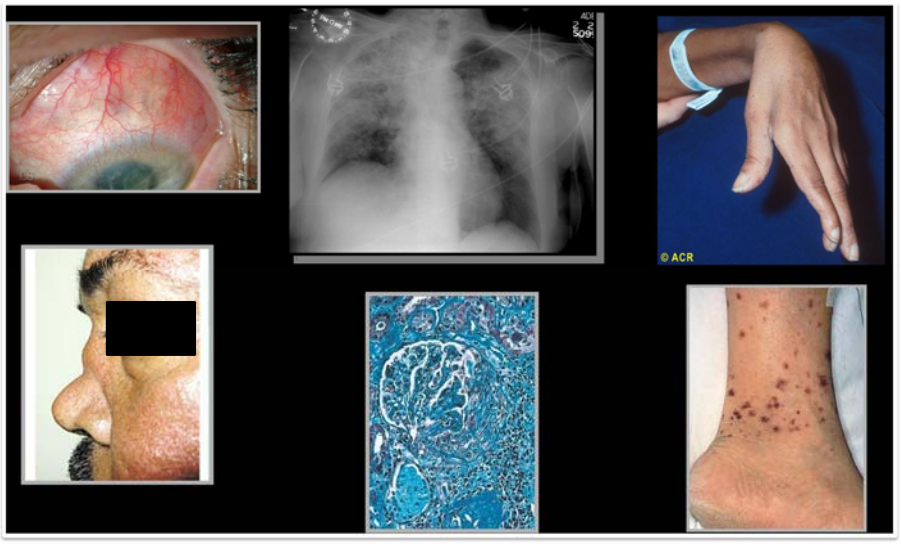
P-ANCA

Myeloperoxidase (MPO)



MAYO CLINIC

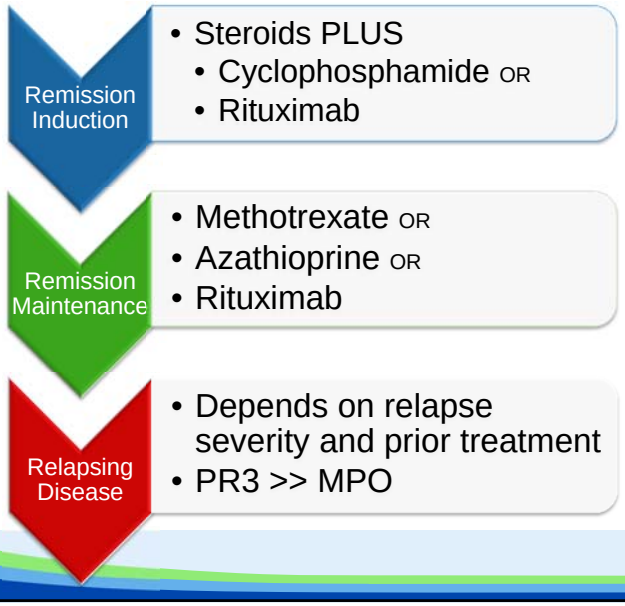
ANCA-associated Vasculitis



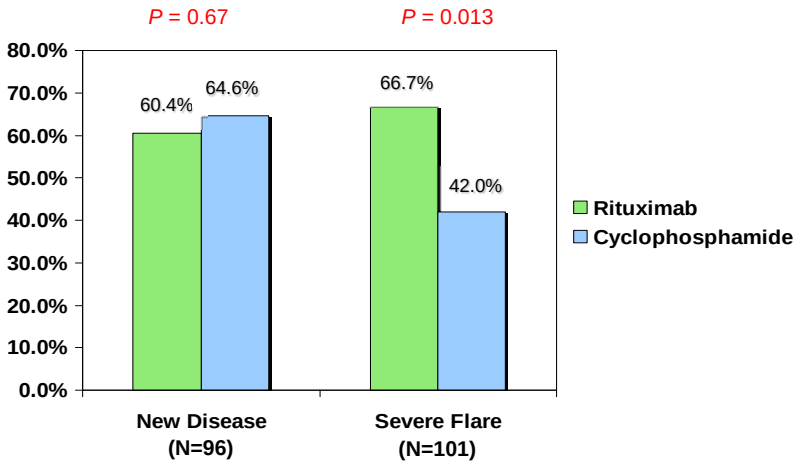
Treatment - principles

- Early intervention essential
- Tailored to the type and severity of vasculitis
  - Co-morbidities
- Remission achievable in almost all patients
  - Relapses common
- Close monitoring
  - Damage
  - Treatment toxicity

Treatment of ANCA Vasculitis



Treatment Response by Disease Status at Baseline – data from the RAVE trial

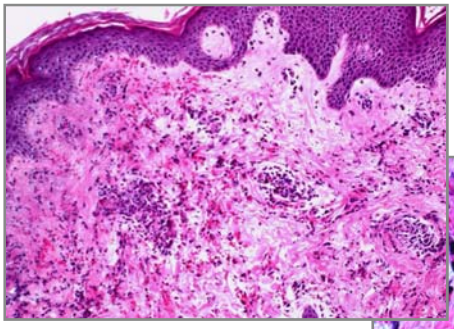


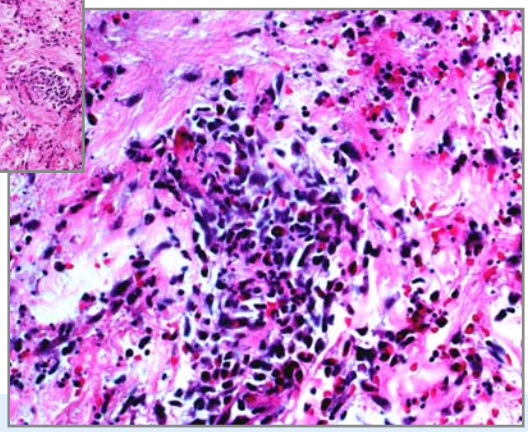
Stone JH et al. N Engl J Med 2010;363:221-232

Case 6

- 47 year old M; history of asthma, nasal polyposis and recurrent sinusitis
- 8 weeks of cough & dyspnea
- Weight loss, low grade fevers
- Recent onset purpuric rash and bilateral foot drop
- ESR 72 mm/1hr; Creat 1.0 mg/dL
- Eosinophils – 40% of WBC
- P-ANCA and MPO positive

Skin biopsy





Vascular necrosis with nuclear dust and perivascular lymphocytes and eosinophils. Many PMN's are fragmented.

Eosinophilic Granulomatosis with Polyangiitis (Churg-Strauss Syndrome)

ACR Classification Criteria

1. Asthma
2. Eosinophilia >10% WBC
3. Mononeuropathy or Polyneuropathy
4. Transitory Pulmonary Infiltrates
5. Paranasal sinus abnormality
6. Biopsy with extravascular eosinophils

*4/6 Criteria (sensitivity of 85% and specificity of 99.7%)

Masi AT et al Arthritis Rheum. 1990 Aug;33(8):1094-100

ANCA-associated Vasculitis

	GPA	MPA	EGPA
Small-Vessel Vasculitis	+	+	+
ANCA	C-ANCA (PR-3)	P-ANCA (MPO)	P-ANCA (MPO)
Necrotizing granulomas	+	-	-
Asthma & Eosinophilia	-	-	+

Cryoglobulinemic Vasculitis

- Small-vessel vasculitis
  1. Cutaneous vasculitis
  2. Glomerulonephritis
  3. Neuropathy
- Labs
  - Positive RF,
  - Cryoglobulins (II)
  - Low complement
  - Hepatitis C

TAKE HOME MESSAGES
Vasculitis

1. Progressive multi-organ disease
   - Unexplained systemic inflammation
2. Multi-specialty evaluation
   - Exclude mimics
3. Prompt diagnosis essential
   - Corticosteroids initial therapy
4. Chronic illness
   - Treatment-related morbidity

MAYO CLINIC

MAYO CLINIC

Assessment Question #1

- True or False
  - Lupus vasculitis is considered to be a secondary form of vasculitis related to a rheumatic disease.

MAYO CLINIC

Assessment Question #2

- True of False
  - Relapses of ANCA vasculitis are common

MAYO CLINIC

Assessment Question #3

- Which of the following medications is appropriate for refractory Takayasu arteritis?
  - A. Steroids
  - B. Azathioprine
  - C. TNF inhibitors
  - D. Methotrexate

MAYO CLINIC

Return to Program Schedule

Primary Raynaud's Phenomenon

T. G. Mason, MD
Associate Professor of Medicine and Pediatrics, Mayo Clinic College of Medicine

Disclosures

- Financial
  - none
- Other
  - Member, test-writing committee for rheumatology, American Board of Internal Medicine (ABIM)

Return to Program Schedule

Disclosure of ABIM Service: Thomas Mason, MD

- I am a current member of the Rheumatology Board Exam Committee.
- To protect the integrity of certification, ABIM enforces strict confidentiality and ownership of exam content.
- As a current member of the Rheumatology Board Exam Committee, I agree to keep exam information confidential.
- As is true for any ABIM candidate who has taken an exam for certification, I have signed the Pledge of Honesty in which I have agreed to keep ABIM exam content confidential.

No exam questions will be disclosed in my presentation.

MAYO CLINIC

Goals

- Recognize the clinical features of primary Raynaud's phenomenon (RP)
- Understand the relationship of RP to rheumatic diseases
- Develop an approach to patients with RP
- Recall initial management strategies for RP

MAYO CLINIC

Historical background

- Maurice Raynaud in 1862 labelled as "local asphyxia of the extremities"
- Result of "increased irritability of the central parts of the cord presiding over the vascular innervation"

Raynaud, M. New researches on the nature and treatment of local asphyxia of the extremities 1874. Translated by Barlow London: New Sydenham Society,1888

Historical background

- Reflex vasodilation produced by warming the body could be overcome by putting the hands in cold water, resulting in vasospasm
- Conversely, that vasospasm could not be produced by body cooling if the hands were kept warm
- Sir Thomas Lewis concluded that Raynaud phenomenon (RP) was due to a "local fault" rather than a defect in the central nervous system

Lewis, T. Heart. 1929;14:7

Which of the following are associated with primary Raynaud's phenomenon?

- Age of onset of 40-50 years
- Men affected as often as women
- Normal peripheral pulses
- Antinuclear antibodies in a nucleolar pattern
- Gastro-esophageal reflux (GERD)

MAYO CLINIC

Which of the following are associated with primary Raynaud's phenomenon?

- Age of onset of 40-50 years
- Men affected as often as women
- **Normal peripheral pulses**
- Antinuclear antibodies in a nucleolar pattern
- Gastro-esophageal reflux (GERD)

MAYO CLINIC

Raynaud's physiology

- Poiseuille's law
- Flow is proportional to radius to the 4th power
- Small changes in radius have huge impact on blood flow

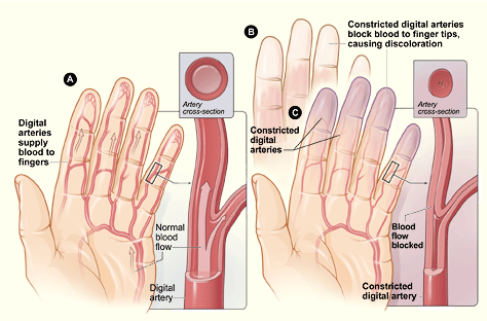

Image from Encyclopedia of Science

MAYO CLINIC

Raynaud's color changes

- Initially, pallor, from increased vasoconstriction
- Eventually, cyanosis from relative ischemia
- Frequently, hyperemia with re-warming (e.g. "over dilation")

MAYO CLINIC

Screening questions: Raynaud's

- *Are your fingers unusually sensitive to cold?*
- *Do your fingers change color when they are exposed to cold temperatures?*
- *Do your fingers turn white, blue, or both*?
  - Dx is made if 3/3 are +

Wigley FM. NEJM. 2002;347(13):1001.

Screening questions: Raynaud's

- Occupational issues: (repetitive trauma, etc.)
- Neuropathies
- Medications
  - Nicotine
  - Stimulants
  - Ergotamine derivatives

Which of the following is the primary mechanism for primary RP?

- Fixed, obstructive arterial lesions
- Thrombotic/embolic vasculopathy
- Small vessel vasculitis
- Overactive vasoconstriction
- Fibrosis of vascular endothelium

MAYO CLINIC

Which of the following is the primary mechanism for primary RP?

- Fixed, obstructive arterial lesions
- Thrombotic/embolic vasculopathy
- Small vessel vasculitis
- **Overactive vasoconstriction**
- Fibrosis of vascular endothelium

MAYO CLINIC

RP mechanisms

- RP is an exaggerated vascular response to cold or stress
- Abnormal vasoconstriction of digital arteries and cutaneous arterioles
- In primary RP, evidence suggests the defect is an increase in alpha-2 adrenergic responses in the digital and cutaneous vessels.

Flavahan NA, et al. J Pharmacol Exp Ther. 1987;241(2):361

Other variables impacting RP

- Sensory (over) reactivity
  - Alpha-2 receptor mediated, esp. primary RP
- Vessel (over) reactivity
  - Endothelial cells
  - Circulating factors
- Vessel structure
  - Fibrosis (scleroderma, etc.)

RP: primary vs. secondary

Primary

- No associated illness
- Onset in adolescence, early adulthood
- Mostly female
- Symmetric attacks

Secondary

- Associated condition/CTD (scleroderma, etc)
- Onset associated with CTD (+/- 2-3 yrs.)
- Male and female
- Attacks can be asymmetric/digital

MAYO CLINIC

Rheumatologic conditions with RP

Rheumatic condition (CTD)	Clinical features
Systemic lupus erythematosus (SLE)	Photosensitivity, mucositis, serositis, arthritis, renal, CNS, hematologic, autoantibodies
Inflammatory muscle disease (IIM)	Proximal muscle weakness, skin findings, lab and bx evidence of myopathy
Scleroderma*	Skin changes, GERD/dysphagia, ILD, pulmonary HTN, calcinosis

MAYO CLINIC

Scleroderma

- Tight skin
- 90% or more have RP
- A common cause of secondary RP
- RP may precede dx of scleroderma by years

Scleroderma

Scleroderma means “tight skin”. The skin tightness can be peripheral, and seen in the image of the hands/fingers, or more central, as shown by the “shininess” of the skin of the thigh area.

Rheumatologic conditions with RP: scleroderma

Diffuse: (PSS)

- RP
- Wide spread skin fibrosis
- Some esophageal disease
- Interstitial lung ds (ILD)
- Anti-Scl-70 Ab

Localized: CREST

- Cutaneous calcinosis
- RP
- Esophageal fibrosis
- Sclerodactyly
- Telangiectasia
- Centromere Ab
- Pulmonary HTN

MAYO CLINIC

Clinical features of scleroderma

Cutaneous calcinosis

MAYO CLINIC

Clinical features of scleroderma

Telangiectasias

MAYO CLINIC

Clinical features of scleroderma

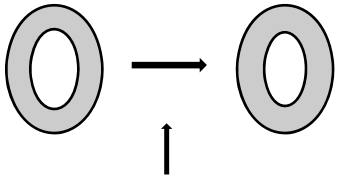
CXR showing pulmonary fibrosis from PSS

MAYO CLINIC

Clinical features of scleroderma

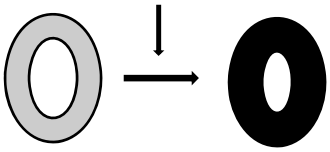
Esophagram showing
decreased peristalsis
in distal 2/3 of esophagus

Physiology of Primary RP



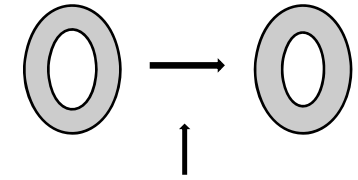
Normal vasoconstriction

Cold exposure, psychologic stress, etc.



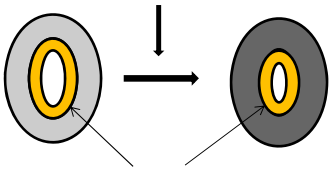
Raynaud's phenomenon

Physiology of Secondary RP



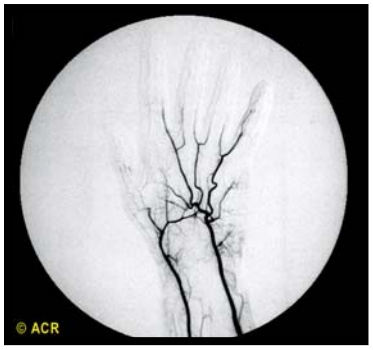
Normal vasoconstriction

Cold exposure, psychologic stress, etc.



Raynaud's phenomenon in scleroderma

Small vessel disease in scleroderma



Chronic ischemia leads to "tapering" of the digits

Which RP patients will get scleroderma?

- 784 consecutive RP pts 1984-1999 (Montreal)
- All had nailfold capillary microscopy
- All had stored sera for autoAb testing
- Most were Caucasian, women, dx at age 40
- Duration of RP 2-3 yrs. at dx

Koenig M, et. al. Arthritis Rheum 2008

Nailfold capillaroscopy

baseline

scleroderma

Just proximal to the cuticle, dilated capillary loops can be seen adjacent to “bare areas” that can be indicative of the vasculopathy of scleroderma

Bolster et al, In Hochberg et al, 2008

Which RP patients will get scleroderma?

Tests	Number	5 yr. f/u	10 yr. f/u
No nail changes, no autoAb	446	6 (1.3%)	7 (1.6)
(+) nail changes, no AutoAb	31	7 (22.6%)	7 (22.6%)
No nail changes, (+) AutoAb	65	14 (21.5%)	21 (32.3%)
(+) nail changes and (+) AutoAb	44	29 (65.9%)	32 (72.7%)
Total	**586**	**56 (9.5%)**	**67 (11.4%)**

MAYO CLINIC

Koenig M, et. al. Arthritis Rheum 2008

RP work-up: history

- Confirm typical color change
- Review exposures
- Features of secondary RP
  - Rashes, serositis, arthritis, etc. for SLE
  - Proximal muscle weakness, rashes for IIM
  - Skin changes, GERD, ILD, etc. for scleroderma

MAYO CLINIC

RP work-up: exam

- Vascular exam
- Skin exam
  - Nail changes
  - Early scleroderma changes
  - Livedo
- Strength assessment
- MSK exam

RP work-up: lab studies

- Acute phase reactants: ESR or CRP
- Organ screening: CBC with diff, U/A, creatinine, etc.
- Autoantibodies:
  - Anti-nuclear (ANA)
  - Extractable nuclear antigens (ENA)
    - Scl-70
    - RNP
  - Centromere

Which of the following Rx is best initial treatment for primary RP?

- Diltiazem
- Lisinopril
- ASA
- Nifedipine
- Sympathetic nerve block

Which of the following Rx is best initial treatment for primary RP?

- Diltiazem
- Lisinopril
- ASA
- **Nifedipine**
- Sympathetic nerve block

Primary RP: Rx treatment

- Education
- Exposure avoidance
- Keeping core temperature up
- Consider vasodilatory Rx

Calcium channel blockers for primary Raynaud's phenomenon

- N = 7 trials, 296 pts
- Nifedipine primary Rx
- About 2 fewer attacks/wk
- "… that oral calcium channel blockers are minimally effective in the treatment of primary Raynaud's phenomenon as measured by the frequency of attacks."

Cochrane reviews 2014

Primary RP: Rx treatment

- Watch for orthostasis
- Calcium channel blockers:
  - Nifedipine
- Alpha-blockers
  - Doxazosin
  - Prazosin

MAYO CLINIC

Summary

- Primary RP is generally a problem of over-vasoconstriction
- It generally starts in adolescence
- Some CTD, particularly scleroderma, can present with Raynaud's (secondary RP)
- Exclusion of CTD can be done by clinical and laboratory assessments
- Treatment of RP includes vasodilatory Rx

Inflammatory Myopathies

Rheumatology Update 2015
L.E. Mertz MD
Rheumatology Division
Mayo Clinic Arizona

Disclosure statement

There are no financial conflicts to disclose.

Return to Program Schedule

Learning Objectives

- List common disorders that cause muscle weakness.
- Name five common inflammatory myopathies.
- Recall the clinical use of biological markers in the diagnosis of muscle disorders.
- Recognize the value of electromyography.
- Order autoantibody testing to confirm and categorize inflammatory myopathies.
- List typical treatments used for inflammatory myopathies.

MAYO CLINIC

Inflammatory Myopathies

<u>Disorders causing true muscle weakness</u>

- Inflammatory myopathies.
- Genetic/metabolic myopathies.
- Drug/toxin induced myopathies.
- Endocrinopathy induced myopathies.
- Paraneoplastic myopathies.
- Central neurologic disorders.
- Peripheral nerve disorders.

MAYO CLINIC

Inflammatory Myopathies

- Polymyositis
- Dermatomyositis
  - Clinically amyopathic dermatomyositis
- Overlap syndromes
  - RA, SLE, Scleroderma, MCTD, SjS
- Necrotizing autoimmune myopathy
  - Drug induced, paraneoplastic
- Inclusion body myositis
- Vasculitis
- Sarcoidosis
- Chronic viral myositis: HIV, Echovirus
- Graft versus host disease
- Eosinophilic myositis

MAYO CLINIC

Inflammatory Myopathies

- Incidence PM + DM: 20/million
- Prevalence PM + DM: 50-220/million
  - 80% have an autoantibody/30-40% have a MSA.
  - 20-80% have interstitial lung disease
  - Dysphagia in 1/3-1/2 of patients
  - Myocarditis is rare
  - Malignancy relative risk: 2.4 for DM, 1.8 for PM
- Incidence IBM: 1-8/million
- Prevalence IBM: 5-70/million
  - Most have no autoantibodies(5' nucleotidase 1A)
  - No interstitial lung disease
  - Dysphagia 1/3-1/2 of patients.
  - Myocarditis not seen.
  - Malignancy: no increased risk.

MAYO CLINIC

Inflammatory Myopathies

Malignancy and Myositis

- DM: relative lifetime risk 2.4 times normal.
  - Applies to amyopathic DM presentation as well.
- PM: relative lifetime risk 1.8 times normal.
- 4.4 1st year, 3.4 yrs1-3, 2.2 years 3-5, 1.6 > 5 yrs
- Type of cancer-adenocarcinoma
  - Cervix, lung, ovary, pancreas, stomach, bladder.
- Malignancy workup
  - Age appropriate cancer screening.
  - HRCT chest, standard CT abdomen, pelvis
  - Possibly transvaginal US in women.

MAYO CLINIC

Inflammatory Myopathies

Worrisome features

- Positive urine hemoglobin without RBCs
  - Suggests myoglobinuria: check urine myoglobin.
    - Increases risk of renal toxicity if CK >15,000-20,000 U/L
    - IV fluids.
- Dyspnea
  - Respiratory muscle weakness, diaphragmatic weakness.
  - Intrinsic lung disease: ILD, DAD.
    - PFTs with inspiratory and expiratory pressures.
    - HRCT
  - Inflammatory cardiomyopathy/myocarditis
    - Cardiac ultrasound or MRI.
- Dysphagia
  - Aspiration, pneumonia.
    - Swallowing study
    - Gastrostomy tube feedings

Dermatomyositis

MAYO CLINIC

Inflammatory Myopathies

- Overlap syndrome
  - Myositis occurring in association with a well defined rheumatologic disorder:
    - Scleroderma>MCTD>SjS, RA, SLE
- Necrotizing autoimmune myopathy
  (Immune-mediated necrotizing myopathy)
  - Drug or malignancy related.
    - Statins
  - Easily confused with PM (no rash)
  - Little or no inflammation on biopsy
    - Macrophages not lymphocytes
  - Autoantibodies: anti-HMG CoA R, anti-SRP
  - Statin assoc: requires immunosuppressive tx.

MAYO CLINIC

Inflammatory Myopathies

The spectrum of statin myopathy

Curr Opin Rheumatol 2013, 25:747–752

Table 1. A comparison of toxic statin myopathy with statin-associated autoimmune myopathy

	Toxic statin myopathy	Statin-associated autoimmune myopathy
Symptoms	Myalgias common; Weakness infrequent	Myalgias common; Weakness common
Maximum creatine kinase (IU/l)	Normal (with mild disease) to >100 000 (with rhabdomyolysis)	1000–50 000 IU/l
Muscle biopsy	Mild disease: cytochrome oxidase negative fibres, vacuolization; Severe disease: myofiber necrosis and regeneration with minimal inflammation	Myofiber necrosis and regeneration with minimal inflammation; MHC class I up-regulation; MAC deposition on nonnecrotic fibers
Genetic risk factors	SNP in *SLCO1B1* gene	HLA-DRB1*11:01
Anti-HMGCR antibody	Absent	Present
Clinical course after statin discontinuation	Improvement	Persistent/progressive weakness and CK elevation
Appropriate therapy	Statin withdrawal (or dose reduction)	Statin withdrawal and immunosuppressive therapy

MAYO CLINIC

Inflammatory Myopathies

- Inclusion body myositis
- Defined clinically and histopathologically
  - Slowly progressive weakness proximal>distal
  - Closely resembles PM
  - Distal involvement of wrist and interosseous muscles characteristic.
  - No lung or cardiac involvement.
  - Dysphagia is common.
  - Severe quadriceps weakness often first visit
  - CK often $\leq$ 2,000-3,000 U/L.
  - EMG: similar to DM and PM, however with neuropathic abnormalities.
  - Muscle biopsy
    - Inflammatory infiltrate similar to PM
    - Inclusion bodies, amyloid deposits

MAYO CLINIC

Inflammatory Myopathies

Myositis associated antibodies

(usually Hep2 ANA positive)

- Anti-SS-A Sjs, SLE, RA overlap
- Anti-U1 snRNP MCTD
- Anti-Sm SLE overlap
- Anti-KU PM/Scleroderma overlap
- Anti-PM/Scl PM/Scleroderma overlap
- Anti-U2 snRNP PM/Scleroderma overlap

Inflammatory Myopathies

Myositis specific antibodies

(May be ANA negative-cytoplasmic, not nuclear)

- Anti-Jo-1 Ab
- Anti-PL-7
- Anti-PL-12
- Anti-EJ
- Anti-OJ

common anti-synthetase antibodies

- Anti-MI-2 DM-like, good prognosis.
- Anti-SRP PM-like, necrotizing autoimmune myopathy, little inflam, poor prog
- Anti-HMGCoAR Statin related necrotizing autoimmune myopathy, little inflammation.

Inflammatory Myopathies

Anti-synthetase Syndrome

Clinical manifestation	+	Anti tRNA synthetase ab	
*Inflammatory myopathy		Jo-1	15-30%
*Interstitial lung disease		PL-7	2-5%
Inflammatory arthritis	PL-12		2-5%
Raynaud's phenomenon		EJ	2-5%
*Mechanic's hands		OJ	<2%
Fever, weight loss		KS	<2%
(one or more in combination)	Ha		<1%
		Zo	<1%

Inflammatory Myopathies

Autoantibodies

- Polymyositis
  - Anti-synthetase syndrome 45%
  - Anti SRP 11%
  - Anti Mi-2 1%
- Dermatomyositis
  - Anti-synthetase syndrome 14%
  - Anti SRP 0%
  - Anti Mi-2 18%
- Overlap syndromes
  - Anti-synthetase syndrome 16%
- Inclusion body myositis(sporadic)
  - Generally no autoantibodies
- Necrotizing autoimmune myopathy
  - Anti SRP antibodies,
  - Anti HMGCoA reductase antibodies.

Inflammatory Myopathies

Anti-synthetase syndrome

Mechanic's Hands

Inflammatory Myopathies

Interstitial Lung Disease

Inflammatory Myopathies
Muscle Biopsy

- Dermatomyositis
  - Perifascicular and capillary inflammation
  - CD4+ Tcells present
  - Complement activation products present.
- Polymyositis
  - Intra-fascicular inflammation present
  - CD8+ T cells present
  - No complement activation.
- Inclusion body myositis
  - Intra-fascicular inflammation present
  - CD8+ T cells present
  - Filamentous inclusions, vacuoles, amyloid deposits
- Necrotizing autoimmune myopathy
  - Similar to PM but necrosis with little or no inflammation.
- Overlap syndrome
  - Like PM

MAYO CLINIC

Inflammatory myopathies

MRI Scanning

- Not routinely done.
- May be helpful in specific circumstances:
  - Identifying muscle edema/inflammation
    - Guide muscle biopsy.
    - Clarify persistent inflammation during treatment.
  - Identifying muscle atrophy/fat replacement
    - Clarify absence of inflammation and opportunity to reduce treatment in end stage myopathy.

MAYO CLINIC

Inflammatory Myopathies
Muscle Enzymes

	Skeletal muscle	Cardiac muscle	Brain	Intestine	Bladder	Lung	Liver	RBCs
CK-MM	99%	80%	10%	+/-	+/-	+/-	-	-
CK-MB	1%	20%	0%	-	-	-	-	-
CK-BB	0%	0%	90%	-	-	-	-	-
Aldolase	+	-	+	-	-	-	+	-
AST	+	+	+	+	+	+	+	+
ALT	+	+	+	+	+	+	+	+

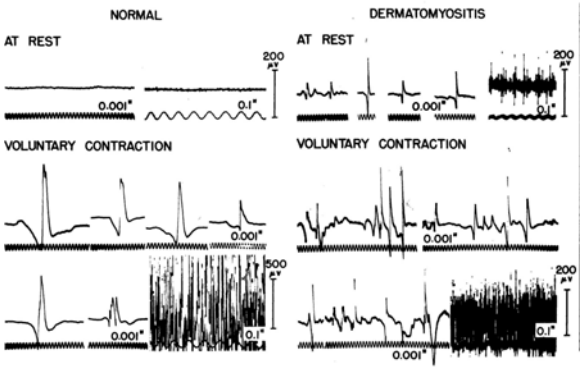
Trop T	+/-	+	-	-	-	-	-	-
Trop I	-	+	-	-	-	-	-	-

MAYO CLINIC

Inflammatory Myopathies
EMG-CMUP



MAYO CLINIC

Inflammatory Myopathies

Treatment Considerations for DM and PM

- Most patients require lifelong treatment.
- Severe muscle weakness can be incapacitating
- Extra skeletal involvement can be life threatening.
  - Pulmonary
    - ILD, respiratory muscle weakness
  - Myocarditis, CHF
  - Severe dysphagia
    - Aspiration pneumonitis
- Infectious complications of treatment can be life threatening.
  - PJP pneumonitis
  - Other infections

MAYO CLINIC

Inflammatory Myopathies

Basic approach to drug treatment of DM and PM

- Minimal treatment duration is approximately 2 years.
- Most patients will relapse on solo corticosteroid tx.
- Initial treatment includes corticosteroids plus a second immune suppressing agent.
  - Most immunosuppressives require months to become beneficial
- Slowly reduce prednisone to the 10 mg/day range over 6 months.
- Attempt to eliminate prednisone between 6-12 months while continuing the immunosuppressive.
- If an excellent response, slowly reduce and eliminate the immunosuppressive over the next year.
- Observe for relapses.

MAYO CLINIC

Inflammatory Myopathies

Basic approach to drug treatment of IBM,NAM, Overlap

- IBM
  - Generally treatment resistant.
  - Supportive care and physical therapy important.
  - CK often normalizes with treatment but no long term benefit.
  - Treat as for DM and PM in specific circumstances
    - Measurably progressive disease.
    - Progressive dysphagia (IVIG)
- NAM
  - Treat identically to DM and PM.
- Overlap syndrome
  - Usually milder muscle inflammation than DM, PM, NAM, IBM
  - Treatment is usually dictated by the primary rheumatologic condition (SSc, MCTD, RA, SLE, etc)
  - Intensification of ongoing treatment often sufficient.

MAYO CLINIC

Inflammatory Myopathies

Drug Treatment options for DM and PM

- Corticosteroids
  - Prednisone p.o. 1-2 mg/kg daily or higher.
  - Methylprednisolone IV 500-1000 mg daily X 3-5 days.
- Immunosuppressive/corticosteroid sparing
  - Methotrexate s.c. or p.o.
  - Azathioprine
  - Mycophenolate mofetil (ILD)
  - Methotrexate + AZA or MPM
  - Cyclophosphamide (severe ILD)
  - IVIG (add on)
  - Rituximab (refractory or ILD).
  - Tacrolimus
  - Hydroxychloroquine, chloroquine: rash of DM.

MAYO CLINIC

Inflammatory Myopathies

Summary of important points

- Statins cause both toxic and autoimmune myopathies which are treated differently.
- Inclusion body myositis is often associated with distal upper extremity weakness.
- CK-MB and troponin T may be elevated in inflammatory myopathies without cardiac involvement.
- Myositis specific antibodies identify subsets of inflammatory myopathies not found by ANA testing.
- The anti-synthetase syndrome may be seen in association with PM, DM and the Overlap syndrome.
- Treatment of DM and PM will usually require both corticosteroids and an immunosuppressant agent.

MAYO CLINIC

The End

MAYO CLINIC

Inflammatory Myopathies

Which disorder is not an inflammatory myopathy?

1. Polymyositis.
2. Inclusion body myositis.
3. Dermatomyositis.
4. Mixed connective tissue disease.
5. Polymyalgia rheumatica.

MAYO CLINIC

Inflammatory Myopathies

Which disorder is not a known endocrinologic cause of muscle weakness?

1. Hypothyroidism.
2. Hyperparathyroidism.
3. Hypercortisonism.
4. Fibromyalgia.
5. Hypovitaminosis D.

MAYO CLINIC

Inflammatory Myopathies

Which drug is not a known cause of muscle weakness:

1. Methotrexate.
2. Colchicine.
3. Hydroxychloroquine.
4. HMG-CoA reductase inhibitors (statins).
5. Ethanol.

Inflammatory Myopathies

Which two neurologic conditions may result in an elevated creatine kinase :

1. Amyotropic lateral sclerosis.
2. Myasthenia gravis.
3. Sensory motor peripheral neuropathy.
4. Guillian-Barre syndrome.
5. Critical illness myopathy.

Inflammatory Myopathies

Case(49955610)

- 59 year old nurse reports a 4 month history of mild progressively worsening myalgia beginning in the calves then thighs then upper arms.
- Eventually develops weakness and could not walk stairs from the 1st floor to the second floor surgical suites or hang a 3 L irrigation bag on the IV pole.
- Primary care lab: AST 259 U/L, ALT 262 U/L, Alk Phos 58 U/L. Creatinine, CMP, sTSH, CBC normal.
- Urine: normal.

MAYO CLINIC

Inflammatory Myopathies

Case

- CK 13,845 U/L (38-176)
- CK-MB 416.7 ng/ml (<3.8)
- Troponin T 1.330 ng/ml (<0.01)
- ESR = 21 mm/hr, CRP <3.0 mg/L.

MAYO CLINIC

Inflammatory Myopathy

Case

- Medications
  - Amlodipine, ranitidine, lisinopril, estrogen vaginal cream, calcium + vitamin D, ASA 81 mg, fish oil supplement, MVI, kidney bean extract
- PMH
  - HPTN, hyperlipidemia, osteopenia, colon cancer resected 2004, hyst and BSO
  - Recent colonoscopy and mammography normal.

MAYO CLINIC

Inflammatory Myopathies

Case

- ROS
  - No family history of inflammatory rheumatologic disorders or muscle disorders
  - No fever but had lost 15 lbs. Mild alopecia.
  - No rash, dyspnea, dysphagia, abdominal pain, changes in B or B habits.
  - No diplopia, jaw or facial diplegia.
  - Recent onset of Raynaud's phenomenon.

MAYO CLINIC

Inflammatory Myopathies

Case

- Physical Examination
  - No distress. Vital signs normal.
  - No rash, sclerodactyly, synovitis, rales, murmurs, abdominal masses, lymphadenopathy.
  - Could rise from a chair unassisted by arms.
  - Could squat and rise with mild difficulty.
  - Could easily stand on toes and heels
  - Gait was normal.
  - DTRs were normal.

Inflammatory Myopathies

Muscle Group	Left	Right
Cervical flexors	4+	
Cervical extensors	5	
Trapezius	5	5

MAYO CLINIC

Inflammatory Myopathies

Case

- EKG normal
- Chest x ray normal
- Cardiac ultrasound normal
- Urinalysis repeated negative for Hgb
- Urine myoglobin negative
- Troponin I ordered, not reported

MAYO CLINIC

Inflammatory Myopathies

EMG

- **SUMMARY**
  - Nerve conduction studies were normal. The needle examination showed fibrillation potentials in all muscles examined, and small, morphologically simple appearing motor unit potentials with rapid recruitment in these muscles.
- **INTERPRETATION**
  - There is EMG evidence of a moderately severe myopathy with electrodiagnostic features that would predict an underlying pathological substrate of necrosis, inflammation, fiber splitting, or vacuolar change. A left deltoid muscle biopsy would be appropriate.

MAYO CLINIC

Inflammatory Myopathies

Deltoid Muscle Biopsy

- A sparse inflammatory exudate is present at one or two perivascular sites.
- Mild increase in perimysial fibrous and fatty connective tissue
- Dx: myopathy, slight.
- Insufficient evidence to diagnose dermatomyositis.

MAYO CLINIC

Inflammatory Myopathies

Return to Program Schedule

GOALS

- 1- General Concepts
- 2- Clinical Presentation
  - Craneal symptoms
  - Extracraneal symptoms
- 3- Treatment

GCA

- Most common form of systemic vasculitis in adults
  - Incidence: ~ 1/5,000 persons > 50 yrs/year
  - Lifetime risk: 1.0% (F) 0.5% (M)
  - Women > men
  - Northern European ancestry
  - Average age at onset ~73 years

GCA:
2 main components

- Vessel wall inflammation
  - Arterial Stenosis and occlusion
    - Ischemic symptoms
      - Headaches
      - Jaw and limb claudication
- Systemic Inflammation
  - Myalgias
  - Anemia
  - Malaise

MAYO CLINIC

Deng J et al: *Circulation*. 2010;121:906-915

Clinical Case

- 72 year old female presenting with:
  - Malaise for 1 month
  - Low grade fever
  - Right temporal headache for 3 weeks
  - Pain in the jaw when chewing steak
  - Stiffness in the shoulders worse in the mornings
  - ESR : 52 mm/hr

MAYO CLINIC

ACR Classification Criteria

- Age at onset of disease >50 years
- New headache
- Temporal artery abnormality (Tenderness to palpation or decreased pulse)
- Elevated ESR >50 mm/1hr
- Abnormal findings on biopsy of the temporal artery
  - Vasculitis with predominant mononuclear cells or granulomatous inflammation usually with multinucleated giant cells

MAYO CLINIC

Biomarkers for GCA

- ESR
  - 11% have ESR < 50 mm/h[1]
- C-Reactive Protein

– Biopsy proven GCA (2000-2008; 177 cases) [2]
  - Sens 86%; Spec 30%; NPV 88%
    - Outperformed the ESR
    - 4% had normal ESR and CRP

MAYO CLINIC

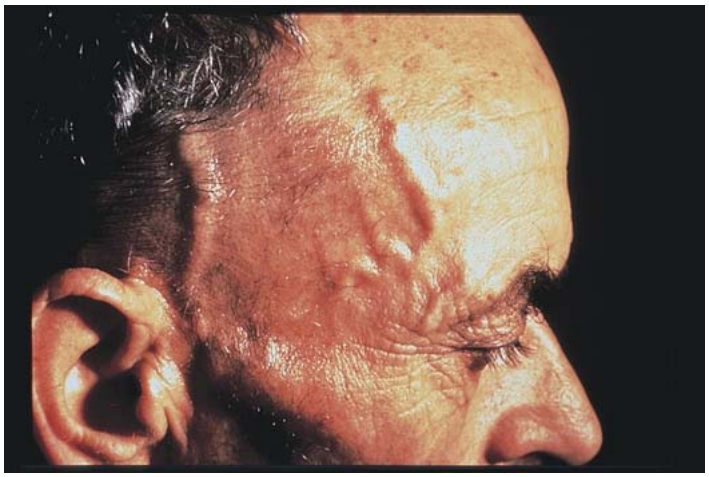
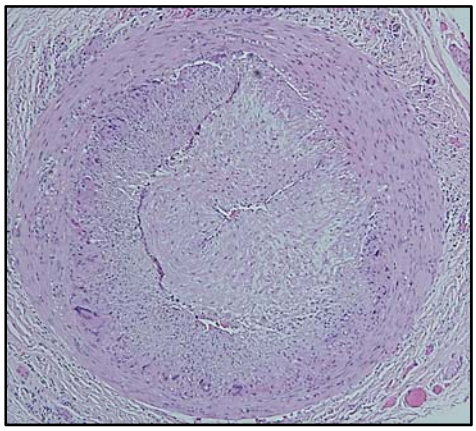
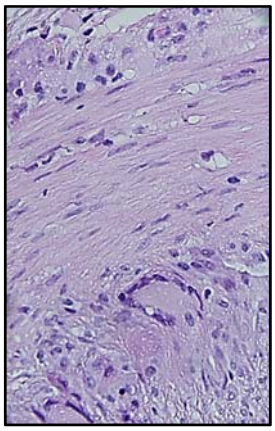
Temporal arteritis



MAYO CLINIC

Temporal Artery Biopsy



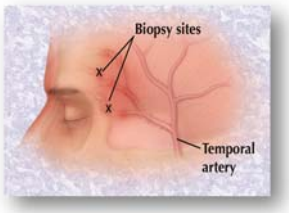


Weyand CM, Warrington KJ. Giant Cell Arteritis. (in Vasculitis 3rd Ed; Ball & Bridges)

MAYO CLINIC

Temporal Artery Biopsy

- Mayo data [1]
  - Rate of positive biopsy: 26.8%
- Positive predictors
  - Weight loss
  - Jaw claudication
  - Clinically abnormal artery[2]
- Referral area didn't matter



1. Rieck KL et al; J Oral Maxillofac Surg. 2011 Jan;69(1):36-40

2. Smetana GW, Shmerling RH. JAMA 2002;287(1):92-101

MAYO CLINIC

TAB- one or both sides ?

- Higher yield with bilateral biopsies
  - Range: 3% - 13%
- Length
  - Generally 1-2 cm; 'skip lesions'
  - Lower yield if <0.5 cm
- Corticosteroids
  - 2-4 weeks - no change in yield

Pless M et al. *J Neuroophthalmol* 2000; 20: 216-8

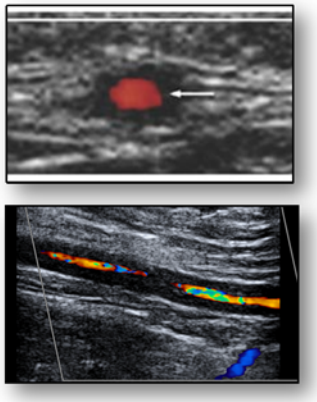
Achkar, A.A., et al., Annals of internal medicine, 1994. . 120(12): p. 987-92.

MAYO CLINIC

Non-invasive diagnosis of GCA

- Ultrasound
  - Hypoechoic 'halo' surrounding the lumen (edema)
  - Disappears promptly with treatment
  - Highly operator-dependent



Schmidt WA. Nature Clinical Practice Rheumatology (2007) 3, 35-42

Bley TA et al. AJNR Am J Neuroradiol. 2007 Oct;28(9):1722-7

'Temporal arteritis' is not always GCA

- TA with Hematologic Malignancy
  - Leukemia:
    - Hairy Cell, CLL, CMML, AML[1]
  - Lymphoma [2, 3, 4]
    - Rare
  - Amyloidosis
- TA with Systemic Vasculitis[5]
  - PAN
  - ANCA-Associated Vasculitis
  - Cryoglobulinemic Vasculitis

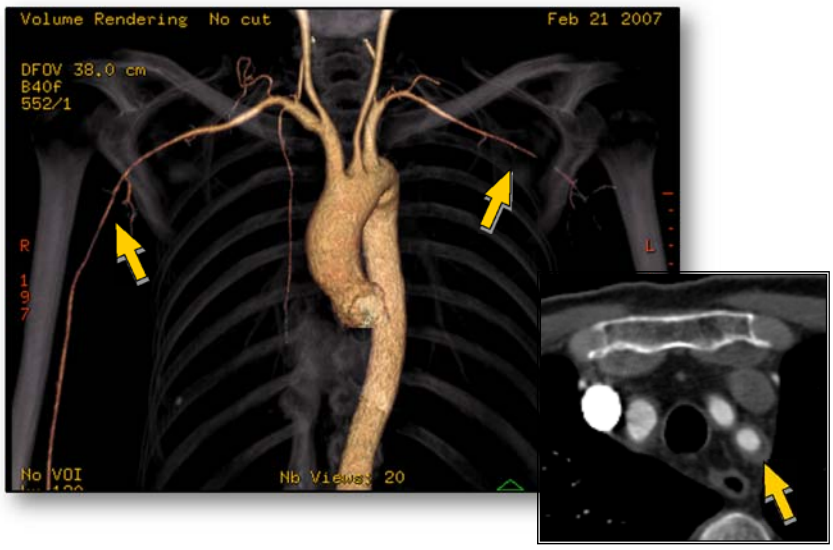
5 Genereau T et al. Arthritis Rheum 1999; 42:2674-81.

Clinical Case 2

- 66 year old female
- Polymyalgia Rheumatica
  - Prednisone taper for 10 months
  - No cranial symptoms or signs
- Past month
  - Weight loss, malaise, left arm claudication
  - BP: (R) 136/82 (L) 90/
  - Left radial pulse: absent
  - ESR 85 mm/hr

GCA - Arterial Stenoses



GCA
Upper Extremity Arterial Involvement

- Frequency by imaging:
  - PET - 74%
  - CT angio - 42%
  - Ultrasound - 30%
- Symptoms < 10%
- Isolated PMR
  - PET – 31%

Kermani TA et al. J Rheumatol. 2009 Oct;36(10):2277-83

Key Points

- Extent of vasculitis is under-recognized[1]
- Careful history and examination
  - Vascular system: pulses, bruit
  - BP measurement
  - Vascular Laboratory studies
- Vascular Imaging

MAYO CLINIC

1. Grayson PC, et al, VCRC. J Rheumatol. 2012 Feb;39(2):303-9

Case

- 67 year-old female; healthy
  - Never smoked
- GCA
  - CRP 130 mg/L
  - Positive TA Biopsy
  - Prednisone (2 yrs)
- 5 years later . . .
  - Asymptomatic
  - Normal exam
  - Normal ESR & CRP

MAYO CLINIC

Aneurysm of the Ascending Aorta

- I am a current member of the Rheumatology Board Exam Committee.
- To protect the integrity of certification, ABIM enforces strict confidentiality and ownership of exam content.
- As a current member of the Rheumatology Board Exam Committee, I agree to keep exam information confidential.
- As is true for any ABIM candidate who has taken an exam for certification, I have signed the Pledge of Honesty in which I have agreed to keep ABIM exam content confidential.

No exam questions will be disclosed in my presentation.

MAYO CLINIC

Goals/objectives

- Recall the classification criteria for the diagnosis of juvenile idiopathic arthritis (JIA)
- Recognize the articular and extra-articular features associated with the various forms of JIA
- To be able to diagnose children with JIA

MAYO CLINIC

Which of the following children is most likely to have JIA:

- 14 y/o girl with 10 months of widespread musculoskeletal pain & RF of 17 (< 15)
- 9 y/o boy with 3 weeks of severe ankle and shin pain that wakes him from sleep
- 5 y/o boy who for the last 18 months gets a sore throat with adenopathy and fever every 2 months
- 3 y/o girl with a painless limp for 3 months

MAYO CLINIC

Which of the following children is most likely to have JIA:

- 14 y/o girl with 10 months of widespread musculoskeletal pain & RF of 17 (< 15)
- 9 y/o boy with 3 weeks of severe ankle and shin pain that wakes him from sleep
- 5 y/o boy who for the last 18 months gets a sore throat with adenopathy and fever every 2 months
- **3 y/o girl with a painless limp for 3 months**

MAYO CLINIC

What is childhood arthritis?

- JRA
  - Swelling, or 2 of these:
    - decreased ROM, painful ROM, tenderness or warmth
  - At least six week duration
  - No other cause
  - Onset before age 16 yrs.

MAYO CLINIC

What is childhood arthritis?

- JIA
  - Swelling, or 2 of these:
    - decreased ROM, painful ROM, tenderness or warmth
  - At least six week duration
  - No other cause
  - Onset before age 16 yrs.

MAYO CLINIC

Other causes:

- Infection related
  - Septic
  - Lyme
  - Rheumatic fever
  - Reactive
- Structure related
  - Joint hypermobility
  - Other (increased Q-angle, etc.)

MAYO CLINIC

Joint hypermobility

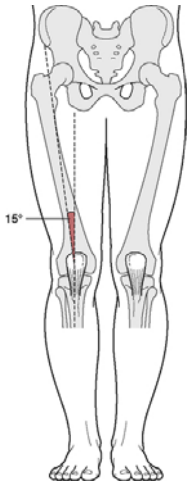
- Aspects of benign joint hypermobility:
  - hyperflexion at hips/back, thumb
  - hyperextension of knee, elbow, fingers
  - No other features (cardiac, ocular, etc.)

MAYO CLINIC

ACR website 2014

Patellofemoral knee pain

- Pes planus
- Foot pronation
- Increased Q-angle
- Wide hips



What is childhood arthritis?

JIA

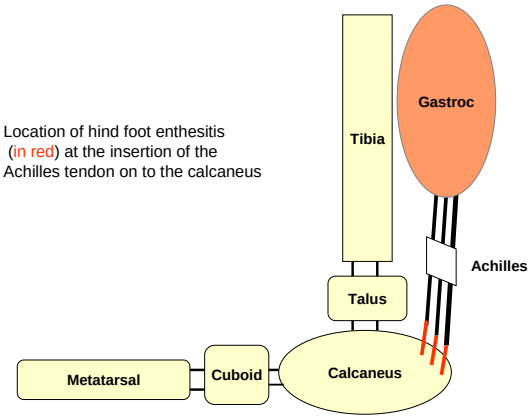
- **9 types**
  - **Systemic-onset**
  - **Polyarticular (+RF/ -RF)**
  - **Pauciarticular**
    - **Persistent**
    - **Extended**
  - **Psoriatic**
  - **Enthesitis-related**
  - **Undifferentiated**

JRA

- **3 types**
  - **Systemic-onset**
  - **Polyarticular**
  - **Pauciarticular**
- **Doesn't include early spondyloarthropathy**

Enthesitis

Location of hind foot enthesitis (in red) at the insertion of the Achilles tendon on to the calcaneus



MAYO CLINIC

Calcaneal enthesitis

MAYO CLINIC

The prevalence (rate) of JIA is …

- 1/100 children
- 1/1,000 children
- 1/10,000 children
- 1/100,000 children

The prevalence (rate) of JIA is …

- 1/100 children
- **1/1,000 children**
- 1/10,000 children
- 1/100,000 children

JIA: pathologic concepts

- JIA is an autoimmune condition
- Prevalence is about 1/1,000
- Incidence is about 1/10,000 per yr.
- Damage is done when misguided immune mechanisms are directed at joint structures
- Many of these mechanisms can be leveraged by various degrees on immunosuppression

MAYO CLINIC

Which of the following is most likely found in a 3 y/o girl with pauci-JIA?

- Elevated serum rheumatoid factor (RF)
- Subcutaneous nodules
- Asymptomatic uveitis
- Decreased ROM of spine
- Spiking afternoon fevers

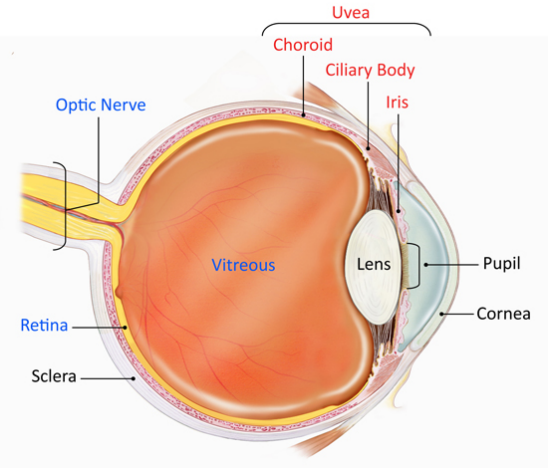
MAYO CLINIC

Which of the following is most likely found in a 3 y/o girl with pauci-JIA?

- Elevated serum rheumatoid factor (RF)
- Subcutaneous nodules
- **Asymptomatic uveitis**
- Decreased ROM of spine
- Spiking afternoon fevers

MAYO CLINIC

Human eye: uveitis

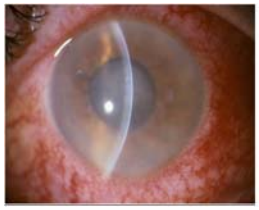


MAYO CLINIC

From national Eye Institute Website, 2014

Uveitis

Anterior uveitis



Posterior uveitis

Uveitis

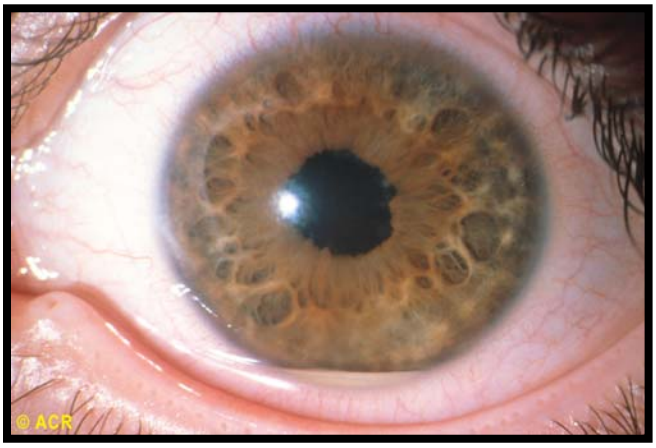
Anterior

- Red eye
- Painful
- Photophobic
- Slit lamp exam optional
- Associated with spondyloarthropathies like AS, IBD, ReA

Posterior

- Not red
- Not painful
- Not usually photophobic
- Slit lamp exam required
- Seen in pauci-JIA, occasionally PsA

Hypopyon form uveitis



JIA: uveitis-risk factors

- Girls (4X)
- Pauciarticular >> polyarticular > PsA
- ANA + (80% of uveitis with + ANA)
- Under age 7 yrs.
- Highest risk group need every q 3-4 month evaluations

Pauciarticular JIA: up to 65%

- Fever & rash absent
- Four or fewer joints involved
- Increased risk for chronic uveitis
- Typically LE joints
- Chance for “extension” (-> poly) = 10-20%
  - Increased if UE involvement
- Prognosis is good
- Tx = NSAIDs, IA injections, MTX

MAYO CLINIC

Left knee involvement with pauciarticular JIA (pauci JIA)

MAYO CLINIC

Left ankle effusion

MAYO CLINIC

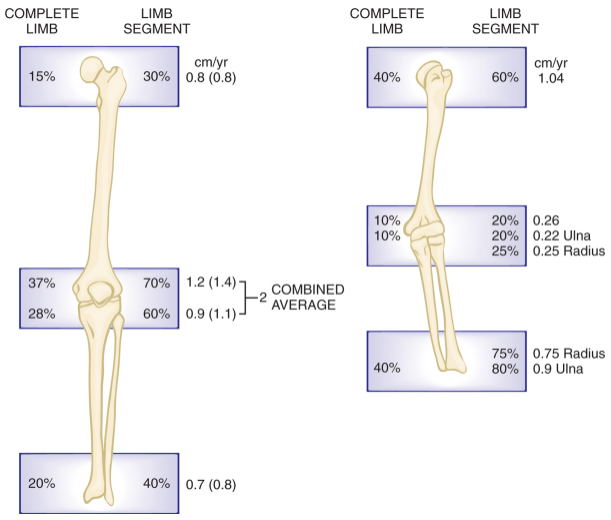
Right knee effusion

MAYO CLINIC

Limb length discrepancy in pauci JIA

- Note the difference in length & girth of the right LE, compared to left. The right knee is effected, resulting in increased growth rate of the right leg

Figure 671-1 The contribution (%) of each physis to the overall length of the extremities. *(From Morrissy R, Weinstein S [editors]: Lovell and Winter's Pediatric Orthopedics, 5th ed. Philadelphia, Lippincott Williams & Wilkins, 2001.)*



Polyarticular JIA: up to 25%

- Fever & rash absent
- Five or more joints involved
- Increased risk joint damage
- Typically UE joints/small joints
- Associated with nodules, autoantibodies
- “Premature RA”
- Tx = NSAIDs, IA injections, MTX, biologics

Synovitis of MCP, PIP and wrist joints, bilaterally in polyarticular JIA (poly JIA)

Incomplete fist

Decreased wrist extension

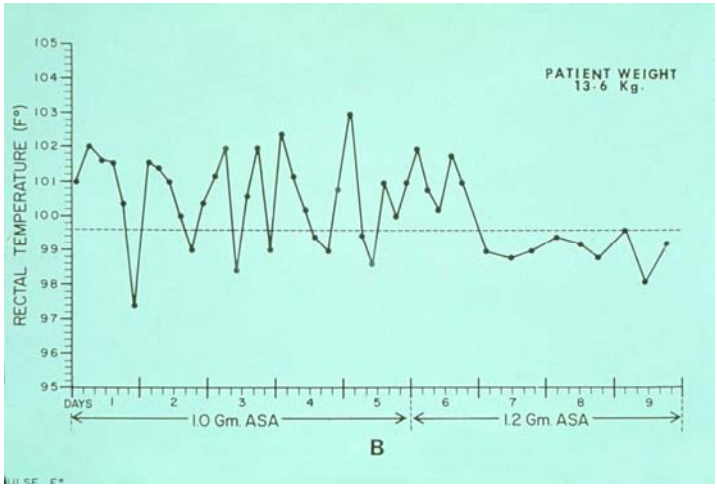
Synovitis of MCP , PIP and wrist joints in poly JIA

Olecranon nodule with poly JIA

Systemic-onset JIA: about 10%

- Fever & rash major features
- Variable number of joints involved
- Increased risk joint damage
- Not associated with autoantibodies
- Elevated acute phase reactants, ferritin
- “Two processes”
  - Articular
  - Extra-articular

Fever pattern in soJIA



Rash from systemic onset JIA (soJIA)

Systemic-onset JIA

- Often seen in hospital/FUO work-up
- Worst prognosis (some related to tx)
- Increased risk joint damage
- Tx now with IL-1 and IL-6 blocker, & MTX, steroids
- Risk of macrophage activation (MAS)
  - Continuous fever, cytopenias, liver dysfunction
  - High mortality risk

Laboratory Studies: Rheumatology

- Acute phase reactants
- Autoantibodies
- Organ assessment
  - Articular: Imaging
  - Extra-articular: Imaging, blood tests, physiologic testing, etc

Suggested laboratory studies: JIA

- Acute phase reactants
  - CBC with diff, ESR, CRP
- Autoantibodies
  - ANA, RF, CCP
- Organ assessment
  - Articular: Imaging: x-rays
  - Other: chemistry, “rule-out” tests

Closing comments

- Is not an acute condition
- Particularly in smaller children is a problem with function, not pain
- Is not associated with night time pain/pain that awakes from sleep
- Is frequently seen with no autoantibodies
- Is often seen with normal acute phase reactants

Closing comments

- Pauci-JIA: associated with *asymptomatic* uveitis
  - + ANA increases risk for uveitis
- Poly-JIA: associated with high risk of joint damage, "precocious RA"
  - + RF (or CCP) increased risk for damage
- soJIA: associated with quotidian fever pattern, elevated acute phase reactants, transient rash
- Remember that CTD can "start out" as JIA, especially in teenagers

Return to Program Schedule

Cutaneous Manifestations of Rheumatologic Disorders

Jason Sluzevich M.D.

Assistant Professor of Dermatology
Department of Dermatology
Mayo Clinic Florida

April 18, 2015

Skin Findings in Connective Tissue Disease

Acquired

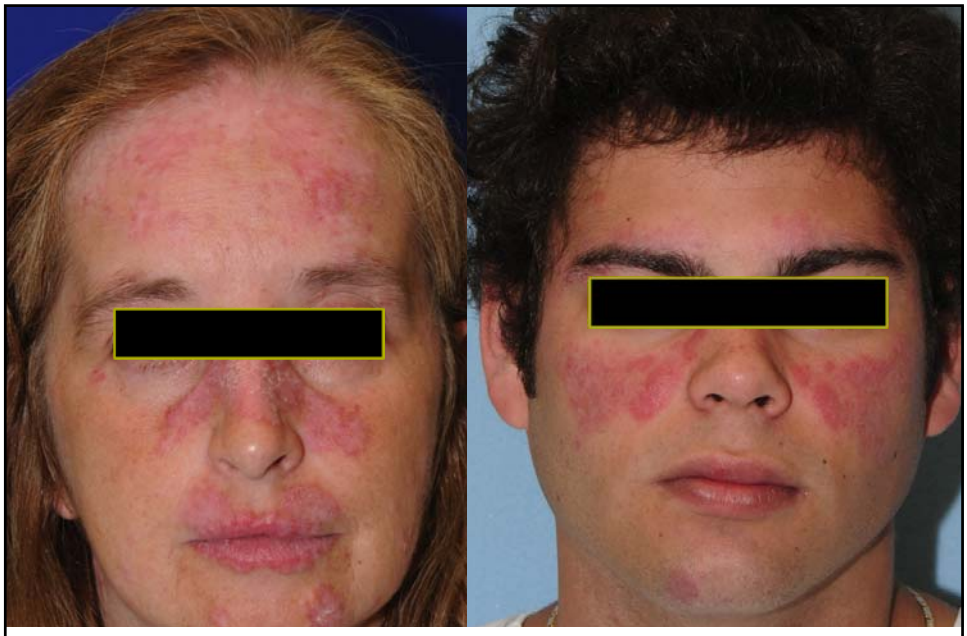
Specific	Lupus
	Dermatomyositis
	Scleroderma & Morphea
	MRH, RA, Sjogren's
Non-Specific	Alopecia
	Vasculitis
	Raynaud's
	Calcinosis cutis

Return to Program Schedule

Lupus Erythematous

Photo distributed erythematous patches/thin plaques

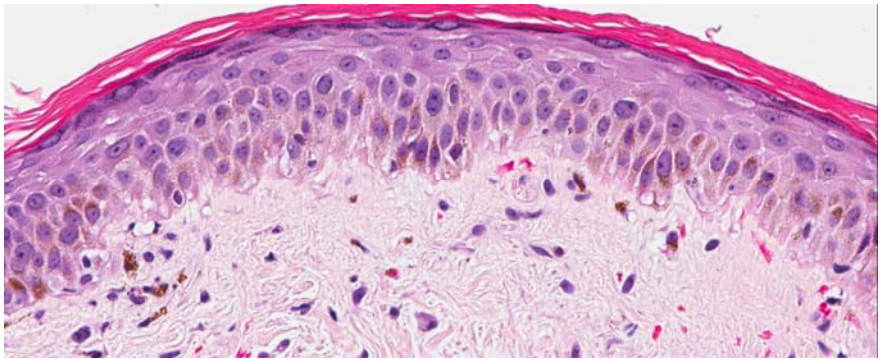
Malar Distribution aka "*Butterfly Rash*"



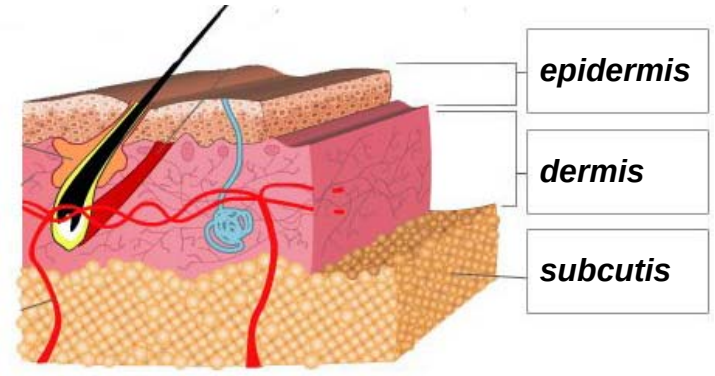
Systemic or Skin Limited?

Skin Biopsies in Lupus

- No difference between skin limited lupus and systemic lupus
- Common pattern: Vacuolar Interface



Forms of Cutaneous Lupus



"Inflammatory Sandwich"

Degree and localization of inflammation produces different forms of skin lupus that are distinctive

Forms of Cutaneous Lupus

Epidermal predominate

- Discoid Lupus

Dermal predominate

- Tumid Lupus

Subcutis (pannicular) predominate

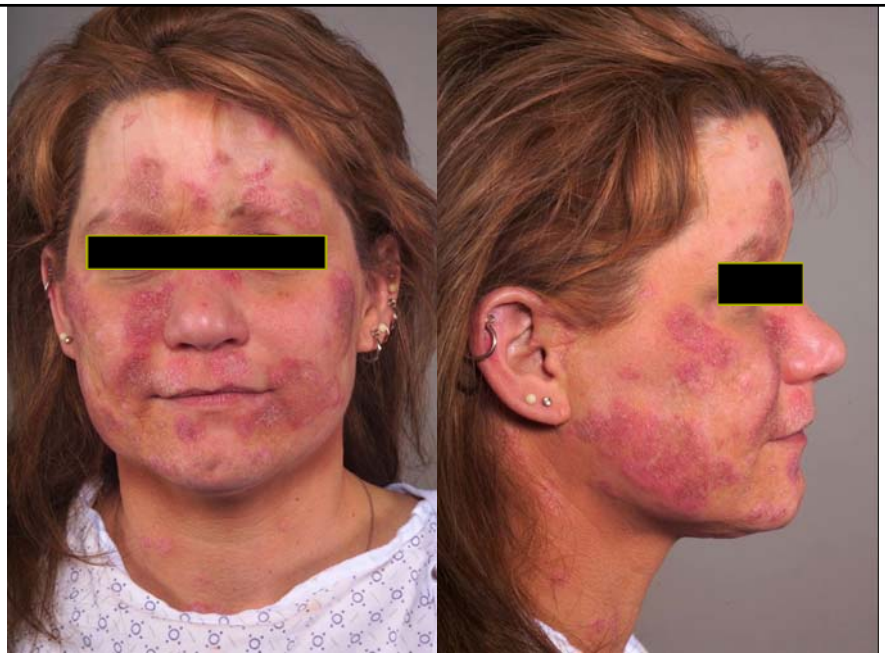
- Lupus Profundus

Sometimes combined patterns are seen.

Discoid Lupus

- Most common form of cutaneous lupus
- Face, ears, scalp preferentially
- Ovoid or round shape
- Scarring and alopecia

MAYO CLINIC



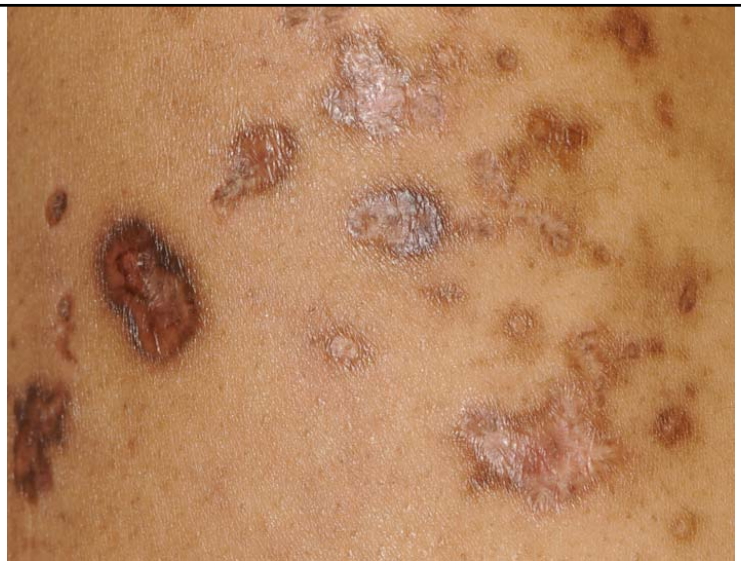
MAYO CLINIC

Discoid Lupus: Active lesions.
Ovoid erythematous scaling plaques. The erythema and scale are signs of active disease.

Discoid Lupus : burns out with time and or treatment. Produces ovoid hypopigmented smooth patches with scarring

ACTIVE DLE	INACTIVE DLE
Scaling red scaling alopecic plaque	Smooth white scarred alopecic patch

In patients of color, hyperpigmentation and hypopigmentation predominate. Erythema is generally less prominent.



ACTIVE DLE: hyperpigmented, scaling, scarring

INACTIVE DLE: centrally hypopigmented, peripherally hyperpigmented, scarring

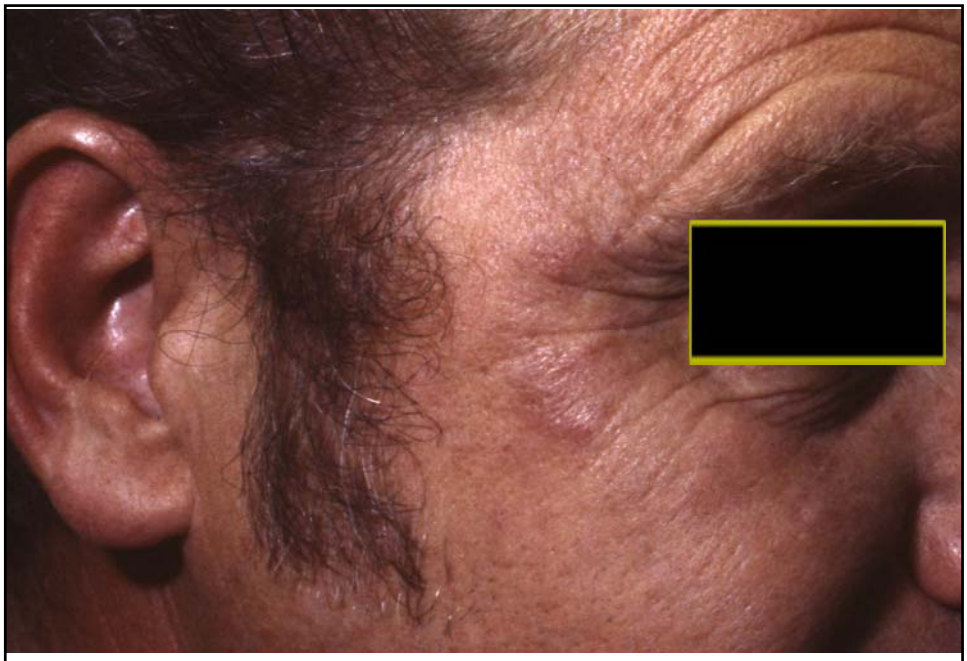
Discoid Lupus
Characteristic Ear Involvement

Tumid Lupus

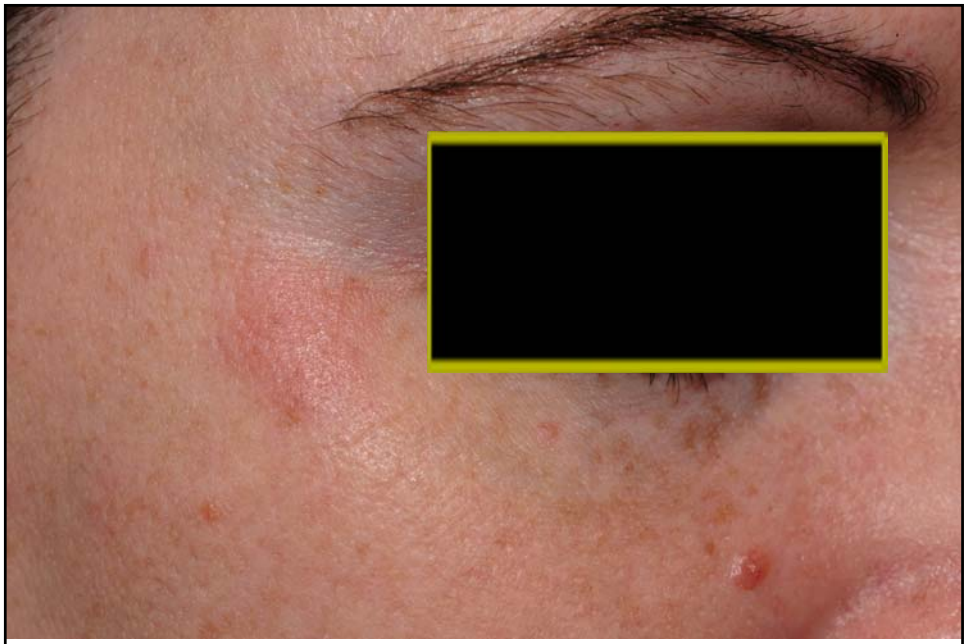
- No scaling
- No scarring but persistent
- Photodistributed on face and torso

- Inflammation restricted to dermis
  - Associated with mucin deposition

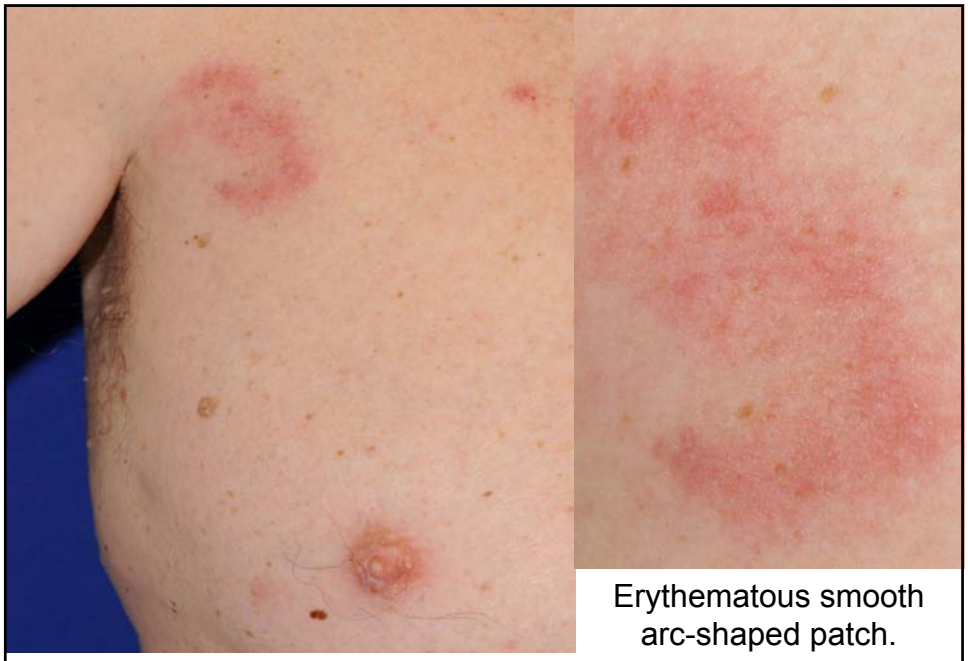
- Smooth erythematous papules and plaques
  - Sometimes annular or arc shaped



Smooth minimally erythematous periocular smooth plaques



Smooth minimally erythematous periocular smooth plaque.
No scarring



Erythematous smooth arc-shaped patch. No scarring.

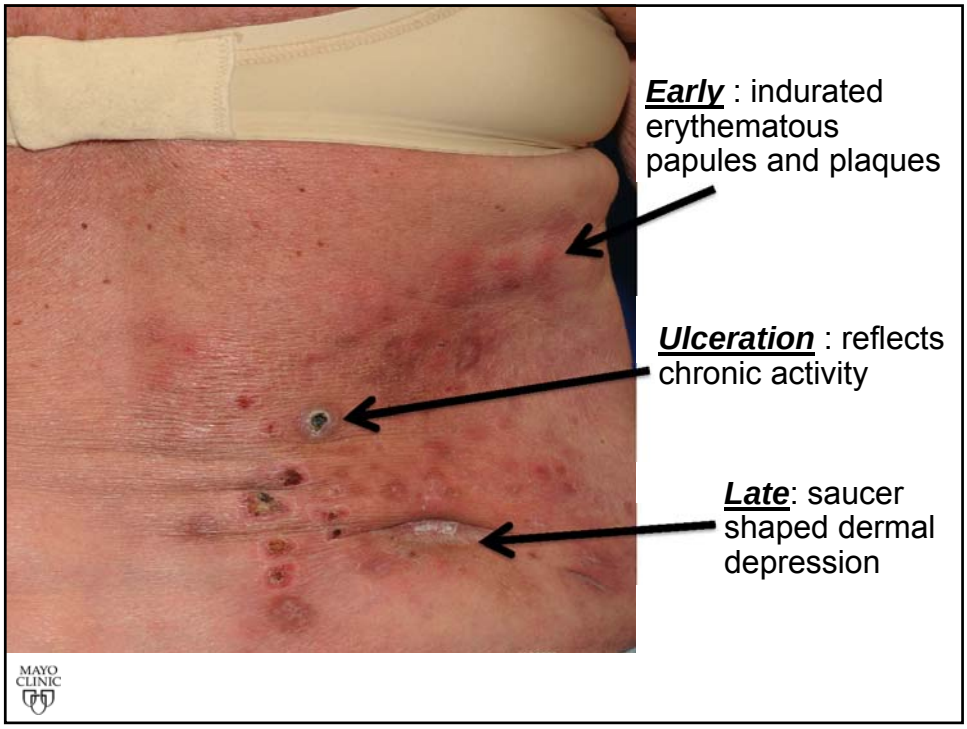
Smooth erythematous non-follicular papules. No scarring.

Subtle skin eruptions can have highly diagnostic skin biopsies

Lupus

- Inflammation in the subcutaneous fat
- Torso preferentially
- Forms dermally atrophic plaques : "*Saucer shaped depressions*"
  - Can ulcerate
  - Can sometimes show overlying discoid lupus

Marked subcutaneous atrophy. Overlying discoid lupus changes.



MAYO CLINIC

Subacute Lupus

- Distinct constellation of signs and symptoms
  - Photosensitive
  - Skin Eruption
    - Annular
    - Psoriasis-like
  - Limited systemic symptoms – arthritis, fatigue
  - ANA positive, Ro and/or La positive
- May meet ACR criteria for SLE but never progress and extra-cutaneous manifestations are otherwise mild.

MAYO CLINIC

Photodistributed (face, chest, back)
annular erythematous scaling plaques

Photodistributed but preferential
lateral face involvement.

Discrete & confluent **annular** plaques

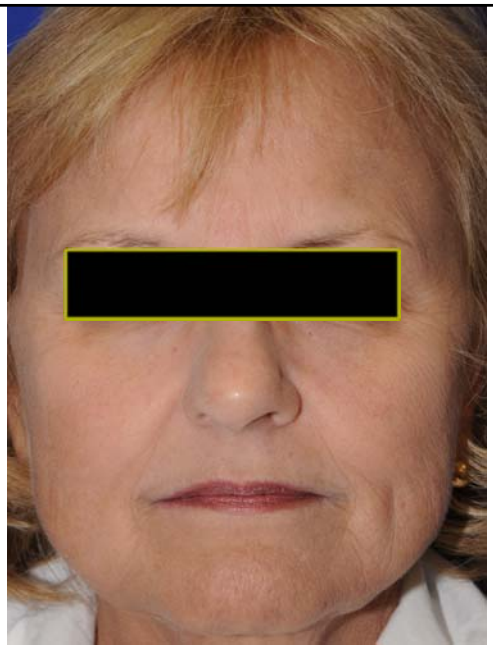
Post-inflammatory Dyspigmentation
<u>No scarring</u>

MAYO CLINIC

More commonly lesions resemble psoriasis.
Same photodistribution.

MAYO CLINIC

Psoriasis-like papules and plaques. Resolve <u>without</u> scarring but can temporarily leave areas of hypopigmentation



Arrows highlight Plaquenil induced hyperpigmentation

2 WEEKS LATER

Most presentations of subacute lupus are rapid and acute.

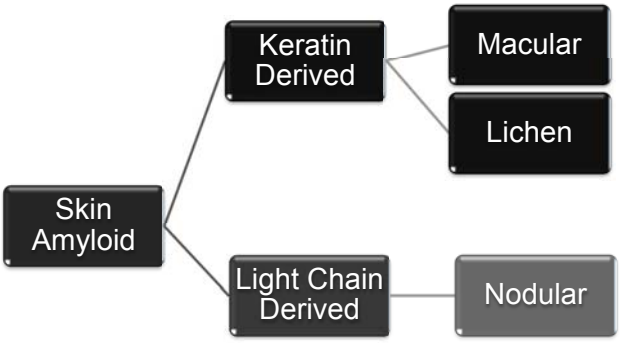
Sjögren's Syndrome

- Rarely has skin involvement:
  - Subacute lupus-like eruption
    - Less extensive often annular
  - Nodular amyloidosis
    - With chronic disease: 10-15 years after dx
    - Part of the lymphoproliferative process that underlies Sjogren's

Arthritis Rheum. 2008 Jul;58(7):1992-9.

Sjögren's syndrome and localized nodular cutaneous amyloidosis: coincidence or a distinct clinical entity?

Meijer JM, Schonland SO, Palladini G, Merlini G, Hegenbart U, Ciocca O, Perfetti V, Leijsma MK, Bootsma H, Hazenberg BP.
University of Groningen, Groningen, The Netherlands.

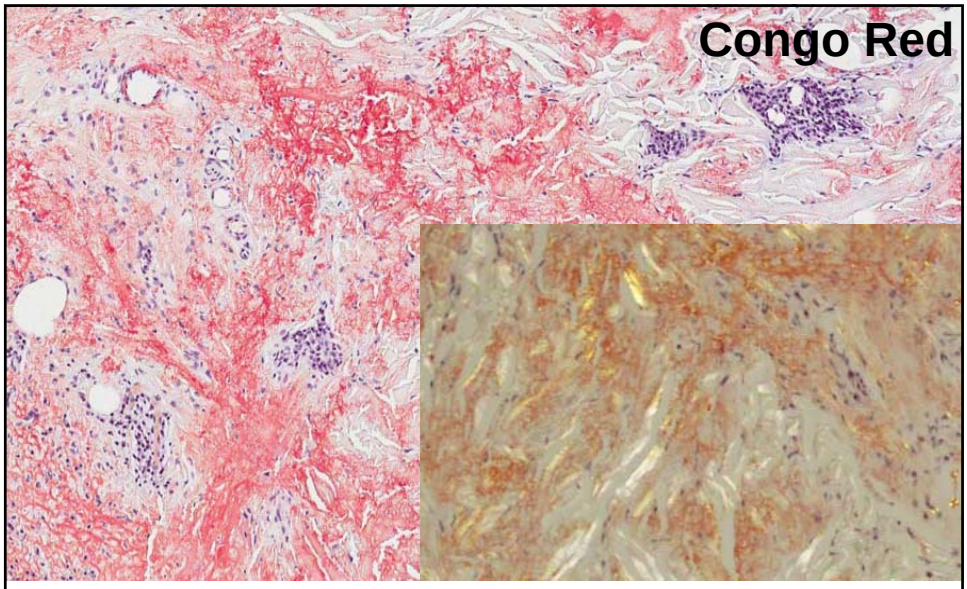


[1] Localized cutaneous (clonal) plasma cell proliferation
[2] Monoclonal Gammopathy
-- r/o Systemic Amyloidosis
-- r/o Multiple Myeloma

MAYO CLINIC

Orangish red-brown smooth nodules and plaques. No specific distribution.

MAYO CLINIC



Diffuse dermal deposition of amyloid
Apple green birefringence with polarization

MAYO CLINIC

Dermatomyositis

MAYO CLINIC

Heliotrope : violaceous patch, with variable edema, symmetrically involving the periorbital face and often forehead

MAYO CLINIC

Notable Notes

The Heliotrope Sign of Dermatomyositis: The Correct Meaning of the Term *Heliotrope*

A common misconception is that the word *heliotrope* refers to the localization of the cutaneous lesions on sun-exposed areas. The terms *heliotrope* and *heliotropic* mean "turning towards the sun" and derive from Greek *helios* (ηλιος), meaning "sun," and *trepein* (τρέπειν), meaning "to turn." Over the years, the term *heliotrope* has been used to indicate things that either reflect or turn to the sun, including an instrument for land survey, a mineral, and, above all, a flower.

The heliotrope sign (HS) indicates a violaceous to dusky erythematous skin eruption, with or without edema, symmetrically involving the periorbital regions and often the forehead (**Figure**, A). Sometimes, a milder form appears as a slight discoloration of the eyelid border. Although it is rare in lupus erythematosus and scleroderma, the HS is a typical feature of acute dermatomyositis. The HS refers to the flower *Heliotropium*, a genus of flowering plants belonging to the family of Boraginaceae. The genus *Heliotropium* includes hundreds of different species, among which *Heliotropium peruvianum* is the most representative and shows small, fragrant, purplish petals (Figure, B). The color heliotrope has been defined in relationship to this flower and has received specific color coordinates that are registered in *A Dictionary of Color*.[1] The similarity between the hue of the periorbital rash of dermatomyositis and that of the petals of the flower justifies the use of the term *heliotrope*.

The flower that turns to the sun in the European countries is the sunflower (*Helianthus annuus*), which Van Gogh immortalized with a vivid yellow color (Figure, C). Therefore, in the absence of knowledge about *H peruvianum*, the HS associated with dermatomyositis would not make sense to European dermatologists, who have their own heliotropic flower, but with a different color. The correct etymology of the term *heliotrope* may be found in the Rheumatology Image Bank website, which mentions the "association rash-flower."[2] Consideration of the etymology of medical terms may be useful to better understand their significance.

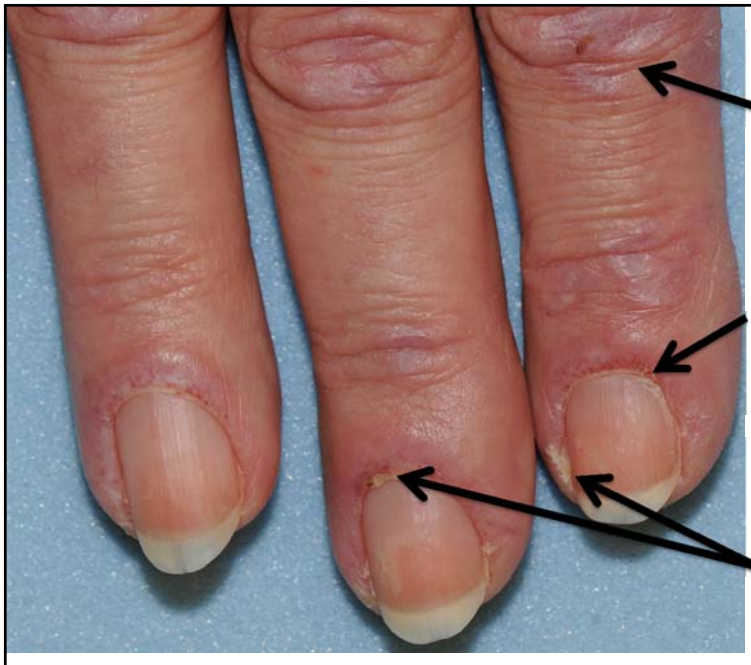
MAYO CLINIC

Highly photosensitive but often not symptomatic

Gottron Papules: Pathognomonic
Violaceous papules overlying bony prominences usually over knuckles

Gottron Papules: May be become confluent and associated with variable erythema and scaling of the dorsal hands

MAYO CLINIC



Gottron Papule

Cuticular Erythema: telangiectasia commonly

Cuticular Scaling:

MAYO CLINIC

Cuticular Erythema:

Nail-fold telangiectasias consisting of loop dilation and arborization

MAYO CLINIC

Cuticular Erythema:

Nail-fold telangiectasias consisting of loop dilation and arborization

MAYO CLINIC

Shawl sign:
Smooth patches over neck, upper back, and shoulders

V-sign:
Smooth patches over neck and upper chest

Extensor violaceous erythema common
Hollister Sign: involvement of the lateral hips

Livid intense erythema with dusky areas and/or frank necrosis is associated with malignancy

Mechanic's Hands
Hyperkeratotic scaling and fissuring of the hands
Associated with underlying interstitial lung disease

Anti-tRNA Synthetase Syndrome

Myositis specific antibodies against the enzyme that links amino acids to transfer RNA

Jo-1: Histidine, PL-7: Threonine, PL-12: Alanine, etc..

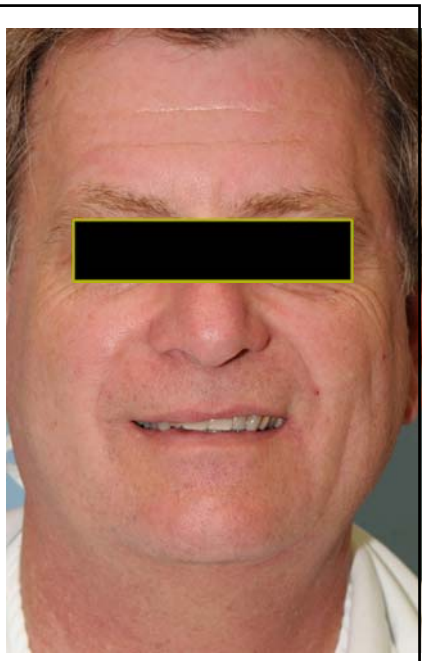
Feature	%
Anti-tRNA Synthetase Ab	100%
Myositis	> 95%
Interstitial Lung Disease	> 60%
Arthritis	> 50%
Raynaud's Phenomena	> 40%
Mechanic's Hands	**30%**
Fever	20%

Mechanic's Hands
Not specific to Dermatomyositis.
Can be seen as isolated sign in other conditions

Dermatomyositis

- Skin findings are heterogeneous
  - Incomplete/absence of any sign
    - Slow insidious presentations
  - Overlap with other conditions
    - Biopsy cannot separate from lupus
- Other confounders:
  - Absence of muscle weakness
  - Negative serologies
    - ANA negative in up to 20% of cases
- Skin signs are
    - Heterogeneous: many, and incomplete

Heliotrope often not prominent



Seborrhea-like Heliotrope

No Heliotrope

Minimal Gottron Change

Subtle Cuticular Change

SLE or DM?

SLE or DM?

Dermatomyositis : Other Clues

- Pruritus
  - DM – often intense; unique among all connective tissue disorders
  - SLE – not pruritic
- Scalp Dermatitis
  - Resembles seborrheic dermatitis or psoriasis
    - No scarring
    - No significant alopecia

Dermatomyositis Scalp Dermatitis
Often pruritic. Resembles seborrheic dermatitis or psoriasis.
No scarring or extensive alopecia.

Multicentric Reticulohistocytosis vs DM

Dermatology. 2011;222(2):102-8. Epub 2011 Jan 20.

Multicentric reticulohistiocytosis with dermatomyositis-like features: a more common disease presentation than previously thought.

Fett N, Liu RH.
Philadelphia VA Medical Center, University of Pennsylvania School of Medicine, Philadelphia, PA 19104, USA. nicole.fett@uphs.upenn.edu

Systemic histiocytic disorder
- Skin Lesions
- Inflammatory arthritis

Mimics some features of DM:
- Muscle weakness
- V & Shawl sign
- ¼ malignancy association

Gottron-like lesions on the hands very common

MAYO CLINIC

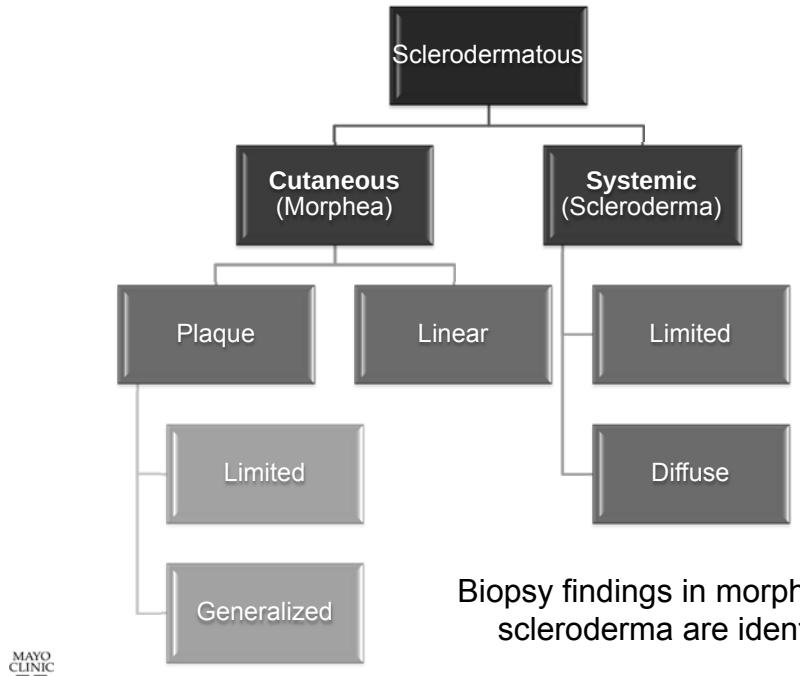
Multicentric Reticulohistocytosis

Discrete and confluent skin-colored to reddish-brown papules involving face and dorsal hands

"String of Pearls"
"Coral Beads"

MAYO CLINIC

Scleroderma



Biopsy findings in morphea and scleroderma are identical.

Scleroderma

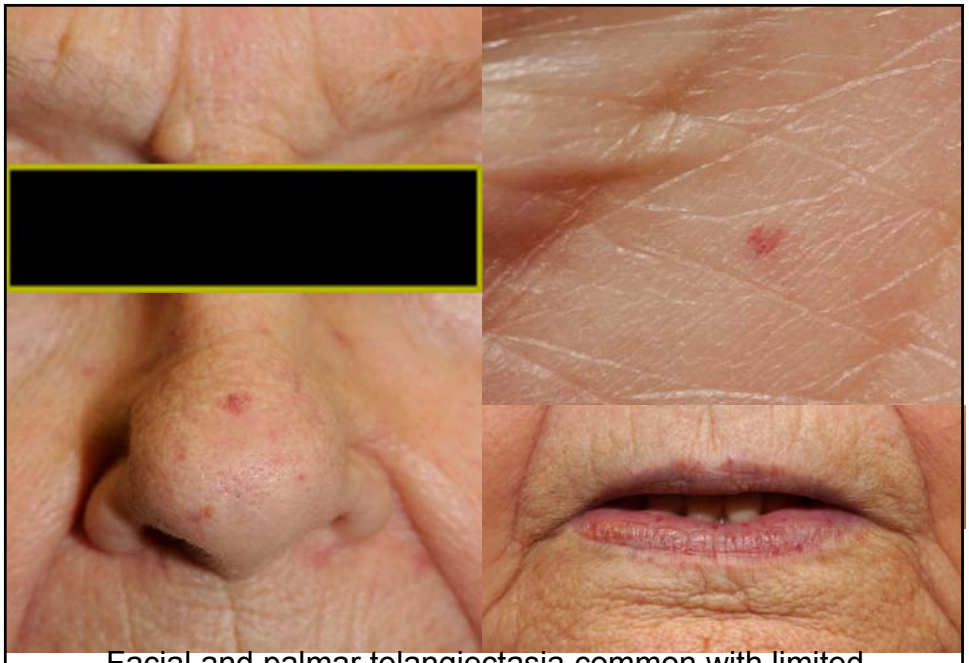
Always Raynaud's

Limited

- Face
- Acral
- "CREST" phenotype
  - Anti-centromere+

Generalized

- Face
- Acral
- Truncal
- Scl-70+ other end-organ



Facial and palmar telangiectasia common with limited scleroderma

Perioral Furrowing

Mottled tan-brown patches

Cuticular Change:

Nail-fold capillary hyperplasia consisting of loop dilation and knock-out

Sclerodactyly:

Progressive distal sclerosis along with vasospasm can result in nail loss and distal ulcers

Localized Scleroderma (Morphea)

EARLY
Hypopigmented indurated plaque with a dusky erythematous to violaceous rim

LATE
Smooth tan-brown ill-defined patches

Extensive generalized cutaneous involvement

Rare pan-sclerotic presentation

Coup de Sabre : Frontal linear scleroderma
Linear band of scleroderma involving frontal-parietal scalp
Produces alopecia

Parry-Romberg Syndrome : Idiopathic hemifacial atrophy
Possible variant of linear morphea
Distinctive feature is pronounced soft tissue loss

MAYO CLINIC

Rheumatoid Arthritis

MAYO CLINIC

Rheumatoid Nodules: Subcutaneous nodules over bony prominences, extensor surfaces or in juxta-articular areas

MAYO CLINIC

TAILS - TNF-α antagonist-induced lupus-like syndrome

Usually seen in the setting of Rheumatoid Arthritis
Reported with etanercept and infliximab
Can switch to another TNF-α inhibitor

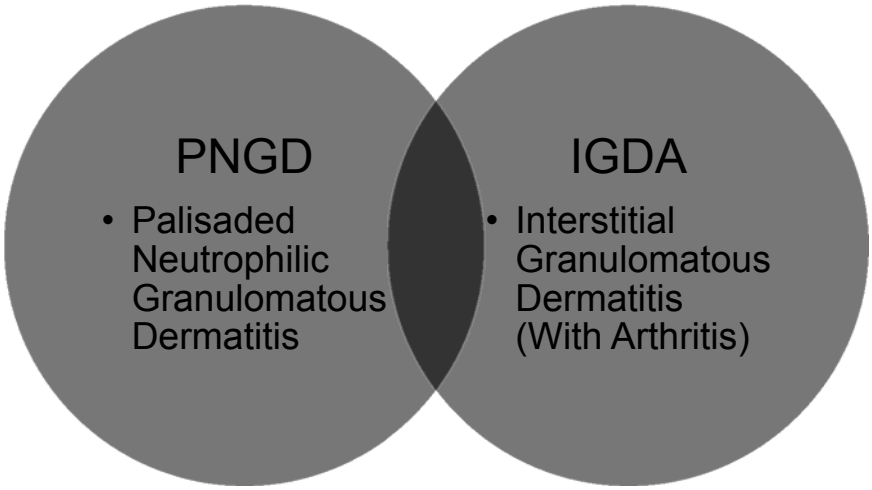
MAYO CLINIC

Psoriasiform reactions to TNF-α inhibitors

Usually seen in the setting of Rheumatoid Arthritis
Reported with adalimumab, etanercept, and infliximab
Is a class effect. Attempt topical management.

Other Eruptions

Granulomatous Dermatitis



RA, SLE, ANCA vasculitis, overlap CTD
May precede diagnosis. Also seen with flares.

MAYO CLINIC

PNGD

- Grouped eruption of erythematous papules with frequent ulceration
- Favors hands and elbows
- Often painful

MAYO CLINIC

Early PNGD: red smooth papules often with a pseudo-vesiculated quality

Late PNGD: crusted eroded scaling papules

MAYO CLINIC

MAYO CLINIC

IGDA

- Slightly erythematous smooth papules and plaques on the trunk and proximal limbs
- Lesions Asymptomatic
- Arthritis often

IGDA

- Slightly erythematous smooth papules and plaques on the trunk and proximal limbs
- Urticarial quality

Clinically subtle changes can have a high diagnostic yield

IGDA: no ulceration, fixed lesions, urticarial quality

MAYO CLINIC

Return to Program Schedule

Psoriatic Arthritis

University of Florida College of Medicine, Jacksonville.

Objectives

- **Describe the clinical features of Psoriatic Arthritis**
- **Explain how to differentiate it from Rheumatoid Arthritis and other Spondyloarthropathies**
- **List common co-morbidities of Psoriatic Arthritis**
- **Summarize the treatment approach to Psoriatic Arthritis**

Return to Program Schedule

Disclosures

- None

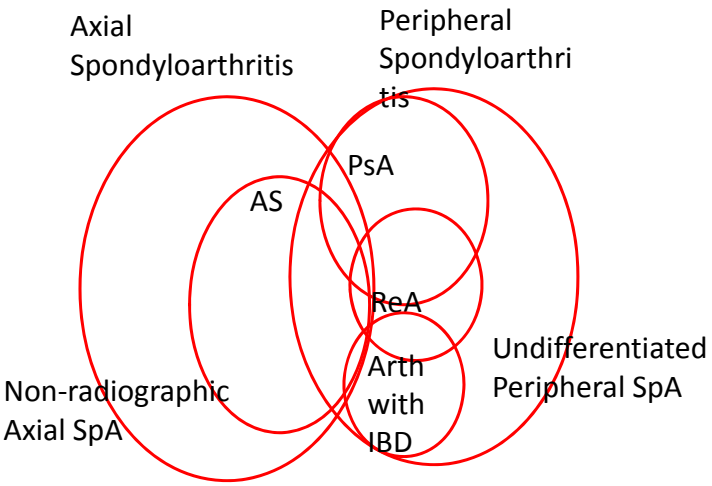
MAYO CLINIC

Concept of Spondyloarthritis (SpA)

MAYO CLINIC

ASAS

Spectrum of Spondyloarthritis: Current Concept



MAYO CLINIC

Psoriasis

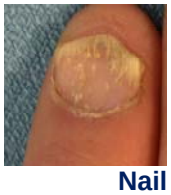
- An inflammatory skin disease
  - affects nails as well
- 1-3% of the population
- Varies from mild to erythroderma
- Leads to reduced QOL
- Increased mortality
- Co-morbidities

Forearm

Legs

Elbows

Hands



Nail lesions

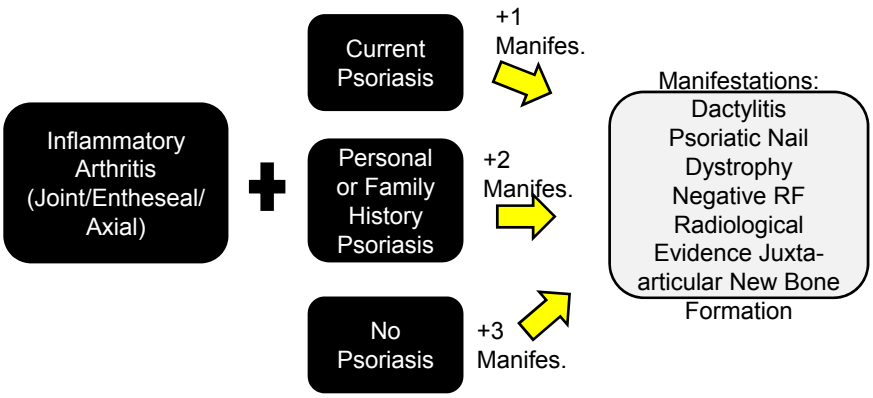
MAYO CLINIC

Psoriatic Arthritis

- Inflammatory musculoskeletal disease
- Associated with psoriasis
- Usually seronegative (RF)
- Associated features
  - Spondylitis
  - Enthesitis
  - Dactylitis
  - Iritis
  - Mucous membrane ulcers
  - Urethritis
  - Other extra-articular features of SpA

MAYO CLINIC

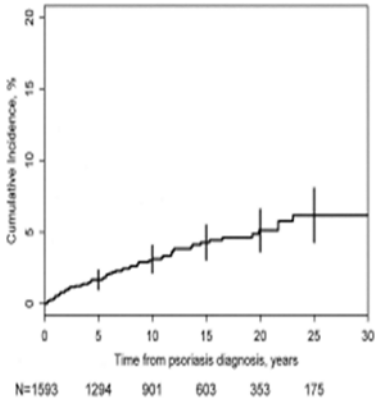
Caspar Criteria for Psoriatic Arthritis



MAYO CLINIC

Taylor et al, Arthritis Rheum 2006; 54: 2665-2673

Clinical Predictors of PsA



Cumulative Incidence at 20 Years: 5.1%
Predictors of PsA
- Scalp Lesions (HR3.9)
- Nail Lesions (HR 2.9)
- Inter-gluteal lesions (HR 2.4)

(Upto 10% of patients may present with arthritis prior to psoriasis)

MAYO CLINIC

Wilson FC et al Arthritis Rheum. 2009 Feb 15;61(2):233-9.

Psoriatic Arthritis

- **5 patterns initially described by Moll and Wright**

Distal

Oligoarthritis

Polyarthritis

Arthritis mutilans

Axial

- **Patterns may change over time**

MAYO CLINIC

Moll JMH, Wright V. Semin *Arth Rheum* 1973; 3:55
Khan M, *et al*. *J Rheumatol* 2003; 30:1022-6

PsA is not Similar to Rheumatoid Arthritis

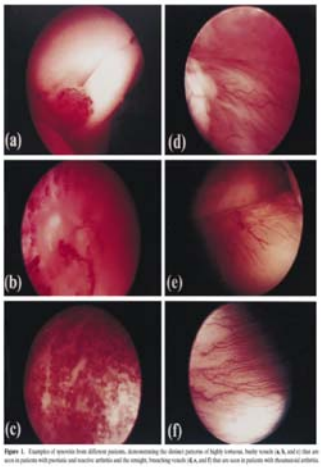
Synovitis
- PsA – Tortuous Busy Vessel
- RA – Straight Branching Vessels

Osteoproliferation
- Feature of PsA
- No osteoproliferation in RA and erosion healing is poor

Erosions
- Hetrogeneous morphology in PsA

Periarticular Inflammation
- Seen more commonly in PsA

Genetics
- RA – DR4/Shared Epitope
- Ps/PsA – HLA Class 1 mild association



Reece RJ et al Arthritis Rheum. 1999 Jul;42(7):1481-4

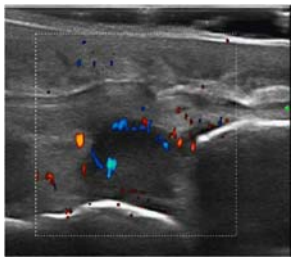
Differential Diagnosis of PsA

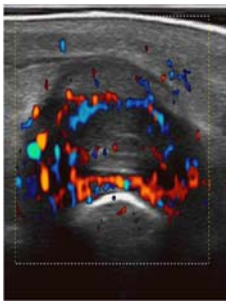
Clinical Feature	PsA	Osteoarthritis	Rheumatoid Arthritis	Gout	Ankylosing Spondylitis
Psoriasis	+	-	-	-	-
Nail Dystrophy	+	-	-	-	-
Enthesitis	+	-	- (rare)	-	+
Peripheral Joints	+	+	+	+	- (Prox Oligoarthritis)
DIP Involvement	+	+	-	+	-
Axial Involvement	+ (Jug like syndesmophytes)	+ (Spondylosis)	+ (C1/2 Level)	+ (rare deposition)	++ (Fine Syndesmophytes)
RF Positive	-	-	+	-	-

Mease PJ, et al Drugs. 2014 Mar;74(4):423-41

Polyarthritis

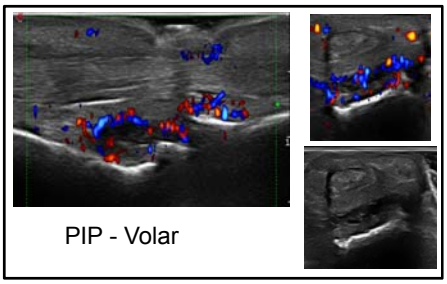
- Symmetric and asymmetric patterns
- Symmetric disease
  - Rheumatoid pattern: PIP,MCP,MTP, wrists, ankles, elbows, knees
  - Symmetric disease is usually more severe with poorer prognosis
- Interphalangeal and wrist joint fusion may occur



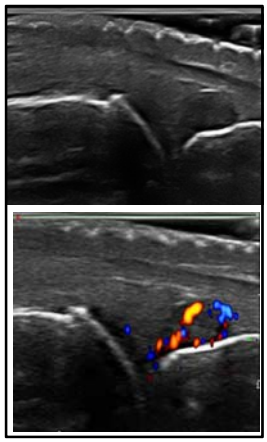


MAYO CLINIC

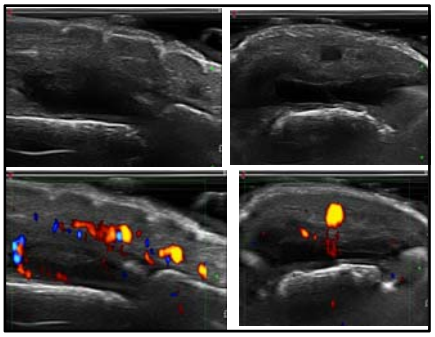
Synovitis



PIP - Volar



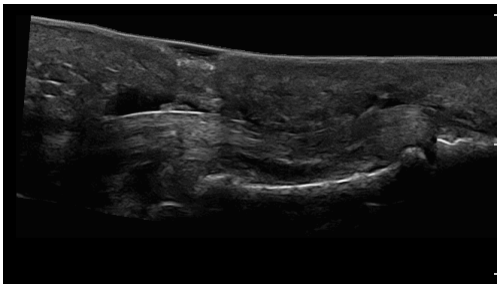
2nd MCP - Dorsal

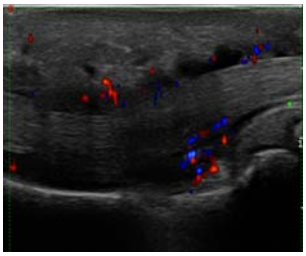


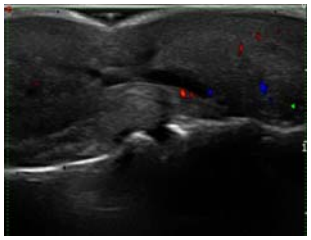
PIP - Dorsal

MAYO CLINIC

Tenosynovitis



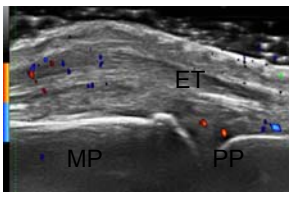


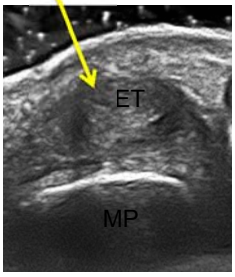


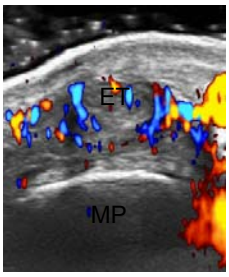
Husic et al Ann Rheum Dis. 2013
Kaeley GS et al. J Rheumatol. 2012;39(2):404-7.

PsA Joint Disease: EXTENSOR TENONITIS

Hypoanechoic material



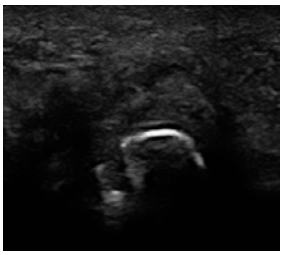




ET – Extensor tendon,
MP – Metacarpophalangeal bone
PP – Prox phalanx

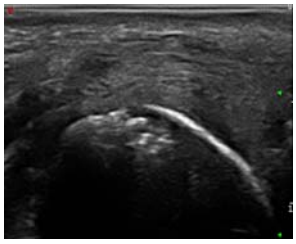
Specific for PsA?? Ramrattan et al ACR 2013, Guiterrez et al ARD. 2011;70(6):1111-4.

Erosions

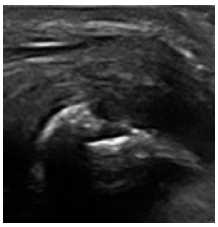


MTP 4 – “RA like erosion”

MCP 1 LONG



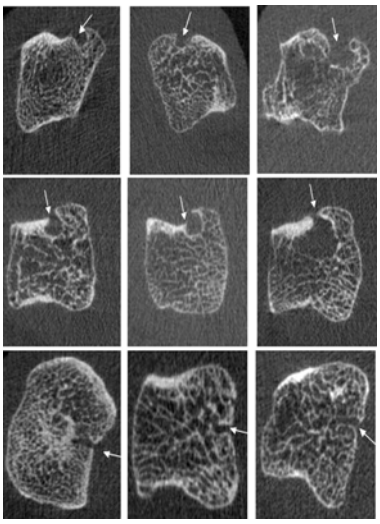
MCP 2 LAT LONG



MCP 1 Short

Husic et al Ann Rheum Dis. 2013
Finzel et al Ann Rheum Dis. 2011;70(1):122-7

Patterns of Bone Erosions Psoriatic Arthritis (PsA)



U-Shaped Erosions – RA and PsA

Ω-shaped Erosions – PsA

T (tubule)-shaped bone erosions
- Channels reaching the bone marrow
- Palmar joint compartment of patients with PsA

Finzel S et al. Ann Rheum Dis 2011;70:122-127

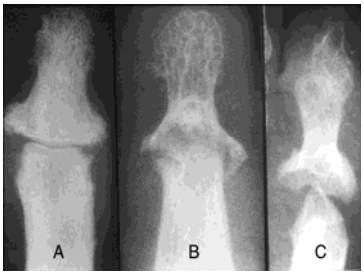
Asymmetric Oligoarthritis

- Oligoarticular or monoarticular distribution
- Affected joints: DIP, PIP, MCP, MTP, Knees, Ankles, Hips
- Dactylitis as well as nail pitting may be seen.

MAYO CLINIC

Distal Interphalangeal Joint Arthritis

- Nail and finger changes frequently associated with DIP arthritis
- May be symmetric or asymmetric
- Associated with distal erosions
- Can be difficult to distinguish from OA in early stages



MAYO CLINIC

Is This PsA?

Arthritis Mutilans

- DIP and PIP joints of hands frequently involved
- Osteolysis and bone loss results in “telescoping” of digits

Clinical Damage in PsA

Predictors for progression

- ≥ 5 swollen joints and a high medication level at presentation
  - Gladman DD, *et al*. *Arth Rheum* 1995; 22:675-9
- Actively inflamed joints at each visit
  - Gladman DD, Farewell VT. *J Rheumatol* 1999; 26:2409
- Number of actively inflamed and damaged joints are independent predictors of damage
- Initial ESR is predictive of future damage
  - Bond S, *et al*. *Ann Rheum Dis* 2007; 66:370-6

MAYO CLINIC

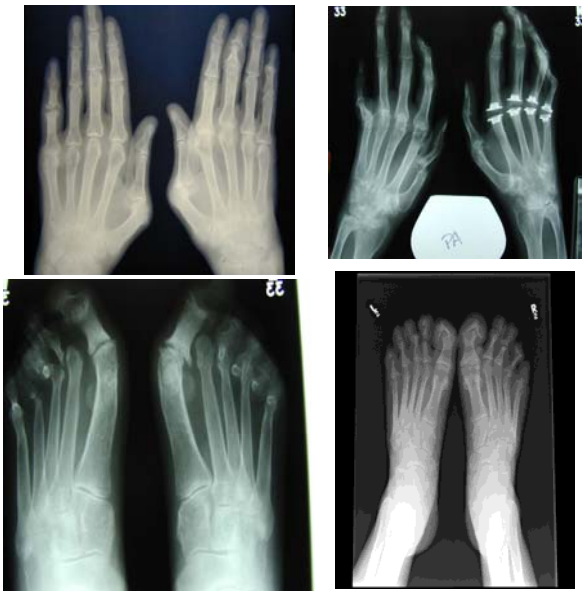
Radiological Damage in PsA

Predictors of Damage & Progression

- Polyarticular presentation predicts future deformities and erosions
  - Queiro-Silva R, et al. Ann Rheum Dis 2003;62:68
- Digits with dactylitis are more likely to have erosive disease than digits without dactylitis
  - Brockbank J, et al. Ann Rheum Dis 2005;64:188-90
- Number of actively inflamed and damaged joints are independent predictors of damage
- Initial ESR is predictive of future damage
  - Bond S, et al. ARD 2007;66:370-6

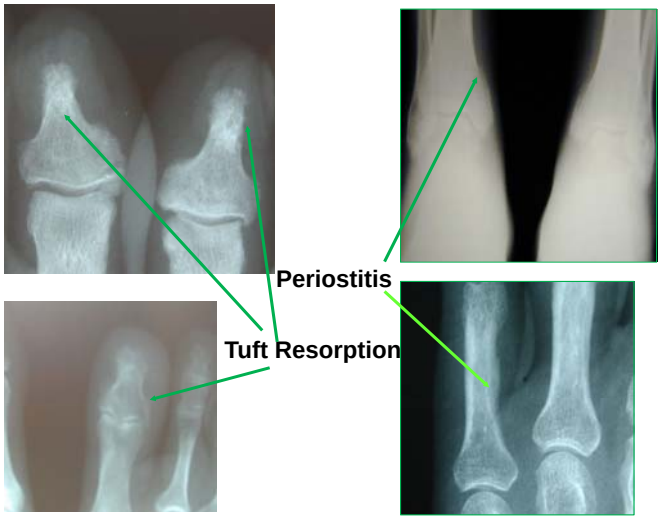
MAYO CLINIC

Radiological Damage in PsA



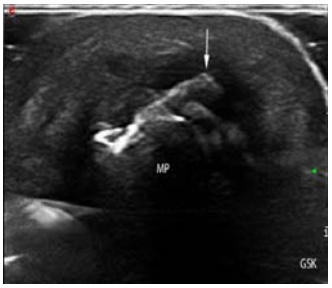
MAYO CLINIC

Other Radiological Features of PsA



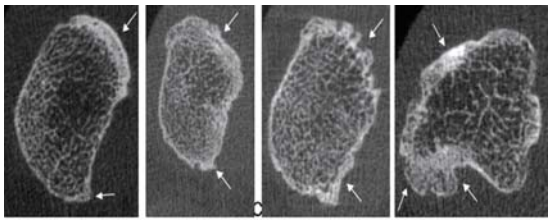
MAYO CLINIC

Osteoproliferation



MAYO CLINIC

Osteophytes and Cortical Surface Lesions in Psoriatic Arthritis (PsA)



Corona-shaped pattern with widespread involvement of the cortical bone

Finzel S et al. Ann Rheum Dis 2011;70:122-127

MAYO CLINIC

ARD

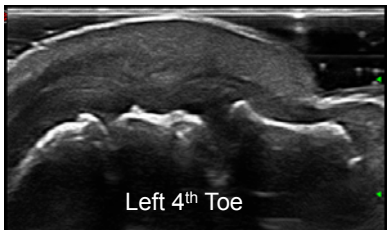
Dactylitis in PsA

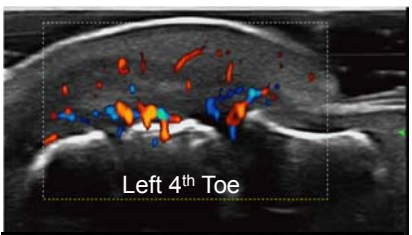
- "Sausage Digit"
- Swelling of whole finger
  - Acute
  - Chronic
- Associated with increased inicidence of erosions.

Chronic

Acute

MAYO CLINIC





Left Foot

Kaeley G, Curr Rheumatol Rep (2011) 13:338–345

MAYO CLINIC

Axial Psoriatic Arthritis

- 15% of PsA patients will develop axial disease by 10 years
- 5% have only axial involvement
- May be asymptomatic
- HLA-B27 Association
- Nail dystrophy, number of radiographically damaged joints, periostitis and elevated ESR increased the risk of developing AxPsA, whereas swollen joints decreased risk
- Radiographic Signs
  - Asymmetric sacroilietis and spondylitis
  - "Jug like" handle syndesmophytes
  - Spondylitis can occur without sacroilietis

Chandran V, et al. *J Rheumatol* 2010; 37:809-5

Extra-articular Manifestations: Enthesitis

- Classical Sites
  - Achilles Tendon
  - Plantar Fascia
  - Pelvic, thoracic and spine insertions

Extra-articular Manifestations: Nails

- 80% of patients with PsA will have nail lesions (>20 pits)
- However, only 40-45% of patients with Psoriasis and not PsA will have nail changes
- Changes include: pitting, transverse ridging, onycholysis, hyperkeratosis, and nail yellowing

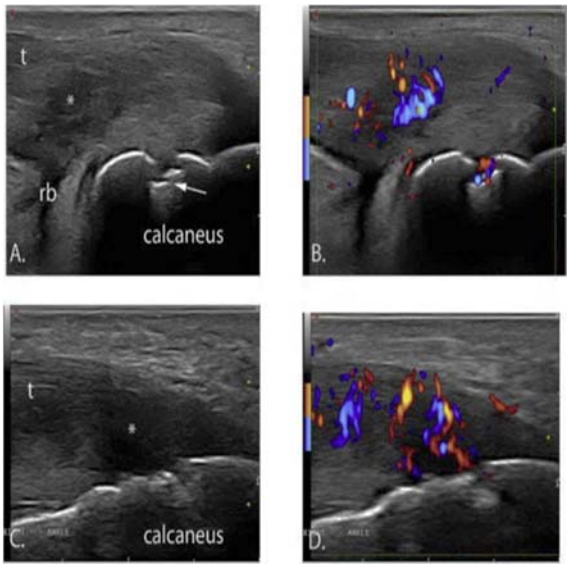
Enthesitis in PsA

Achilles Tendinitis

Achilles Tendon Spur

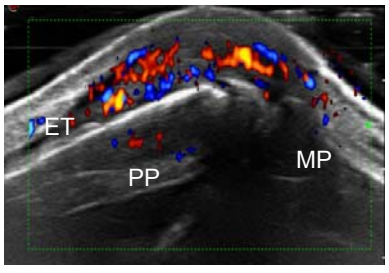
Achilles Tendon Insertion Erosion
Plantar Spur

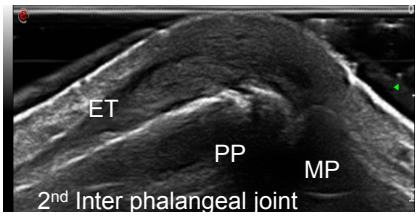
Sonographic Features of Achilles Enthesitis



Lennart Jans , Jacob L. Jaremko , Gurjit S. Kaeley
Novel imaging modalities in spondyloarthritis
Best Practice & Research Clinical Rheumatology, Volume 28, Issue 5, 2014, 729 - 745

PsA Joint Disease: Periarticular Inflammation





ET – Extensor tendon,
MP – Mid Phalange, PP – Prox phalanx
ET – Extensor tendon

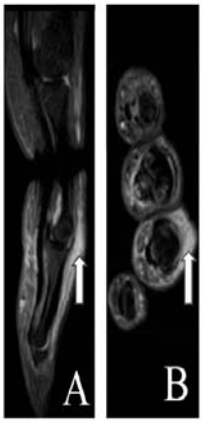


Figure 3. Sagittal (A) and axial (B) short tau inversion recovery (STIR) magnetic resonance images of the 4th finger. Arrows mark periarticular inflammation.

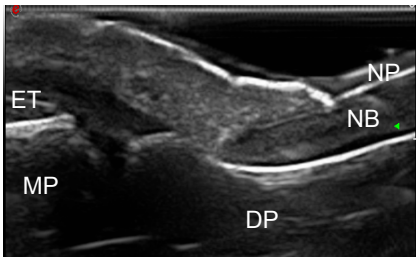
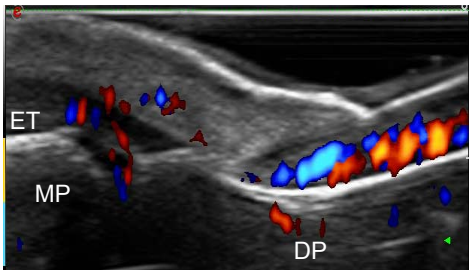
Poggenborg RP, et al. Ther Adv Musculoskelet Dis. 2011;3(1):43-53.

PsA Joint Disease: Extensor Tendon Enthesitis



ET – Extensor tendon,
MP – Mid Phalanx
DP – Distal phalanx
NB – Nail bed
NP – Nail plate



EXTENSOR TENDON ENTHESITIS

NAIL BED THICKENING AND HYPERVASCULARITY

MAYO CLINIC

Uveitis in PsA and SpA

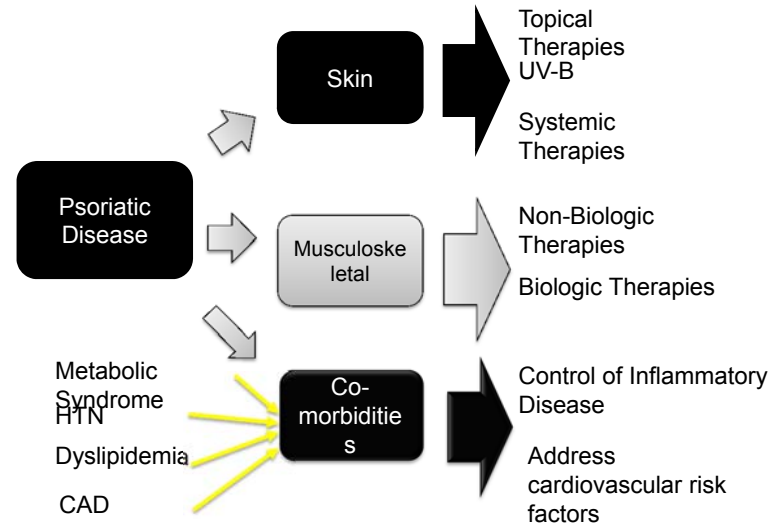
	PsA (n=16)	SpA (n=89)
Insidious onset	19%	3%
Bilateral	37.5	7.0%
Continuous inflammation	31%	6%
Posterior	44%	17%

Pattern of uveitis in PsA similar to that observed in IBD

MAYO CLINIC

Paiva ES *et al*. *Ann Rheum Dis* 2000; 59:670

Treatment of Psoriatic Disease



Musculoskeletal: Joints / Entheses / Dactylitis/ Axial Disease

Approved Therapies for PsA

Drug	Class	Region(s) where approved for PsA	Dose
Treatments approved for PsA			
Methotrexate[105,106]	Nonbiologic DMARD	Canada, Europe	Up to 25 mg per week (oral)
Leflunomide[159]	Nonbiologic DMARD	Europe	20 mg per day (oral)
Adalimumab[101,106]	TNF inhibitor	U.S.A., Europe, Japan	40 mg SC every other week
Etanercept[106,122]	TNF inhibitor	U.S.A., Canada	50 mg SC every week
		Europe	25 mg SC twice per week
Golimumab[106,123]	TNF inhibitor	U.S.A., Europe, Canada	50 mg SC every month
Infliximab[106,124]	TNF inhibitor	U.S.A., Europe, Canada	5 mg kg^{-1} body weight IV at weeks 0, 2 and 6, and every 8 weeks thereafter
Certolizumab pegol[159,167]	TNF inhibitor	U.S.A.	400 mg SC at weeks 0, 2 and 4, followed by 200 mg every other week; for maintenance dosing, can consider 400 mg every 4 weeks
Ustekinumab[155,159]	IL-12/−23 inhibitor	U.S.A., Europe	45 mg SC initially and 4 weeks later, followed by 45 mg every 12 weeks. For patients > 100 kg with coexistent moderate-to-severe plaque psoriasis: 90 mg SC initially and 4 weeks later, followed by 90 mg every 12 weeks

Boehncke WH et al Br J Dermatol. 2014 Apr;170(4):772-86.

Non-approved Therapies for PsA

Treatments not approved for PsA			
Sulfasalazine[116,159]	Nonbiologic DMARD	Not applicable	2–3 g per day (oral) in two divided doses[a]
Ciclosporin A[121,159]	Nonbiologic DMARD	Not applicable	2·5 mg kg^{-1} per day in two divided doses[a,b]
Abatacept[159,168]	T-cell costimulatory inhibitor	Not applicable	10 mg kg^{-1} 2 and 4 weeks after first infusion, then once per month IV or a single infusion loading dose (10 mg kg^{-1}), followed by 125 mg SC within 1 day, and 125 mg every week thereafter[c]
Tocilizumab[159,169]	IL-6R inhibitor	Not applicable	4–8 mg kg^{-1} IV every 4 weeks[c]
Secukinumab[159–161]	IL-17 inhibitor	Not applicable	Up to 300 mg per month (SC)[d]
Brodalumab[159]	IL-17R inhibitor	Not applicable	70–210 mg (SC) every 2 weeks or 280 mg (SC) monthly[e]
Apremilast[164]	PDE-4 inhibitor	Not applicable	20 mg twice daily or 40 mg once daily (oral)
Tofacitinib[159,165,170]	Selective JAK inhibitor	Not applicable	5 mg twice daily (oral)[f]

MAYO CLINIC

Boehncke WH et al Br J Dermatol. 2014 Apr;170(4):772-86.

Therapies for Psoriatic Arthritis

Drug	Signs/ Symptoms	Radiographic Progression	Enthesitis	Dactylitis	Axial Involvement
Methotrexate	+/-	Inconclusive	Unknown	Unknown	-
Sulfasalazine	+	-	-	-	-
Leflunomide	+	Unknown	Unknown	Unkown	-
Cyclosporin	+	Unknown	Unknown	Unknown	-
Apremilast	+	Unknown	Unknown	Unknown	Unknown
Anti-TNF Ab	+	+	+	+	Unknown
Anti IL 12/23 (Ustekinemab)	+	+	+	+	Unknown

Anti-TNF: Etanercept, Infliximab, Adalimumab, Golimumab, Certolizumab,

MAYO CLINIC

Mease PJ et al Drugs. 2014 Mar;74(4):423-41.

Psoriatic Disease and Systemic Corticosteroids

- Psoriasis
  - Use discouraged due to flareup of Pustular Psoriasis on withdrawal
  - Use of systemic steroids common amongst primary care providers
  - Limited evidence for use of systemic steroids in Psoriasis
- PsA
  - Limited data for use of oral corticosteroids
  - Intra-articular injections – one trial has shown fair response

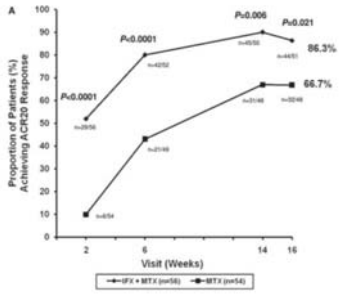
Semble AL et al, Dermatol Online J. 2014 Mar;20(3)
Acosta Felquer et al J Rheumatol. 2014 Nov;41(11):2277-85
Mrowietz U et al J Eur Acad Dermatol Venereol. 2013 Aug;27(8):1022-5.

MAYO CLINIC

PsA and the Methotrexate Conundrum

- MIPA Study - RCT
  - 221 Subjects
  - MTX (upto 15mg oaw) vs Placebo
  - Approx 2/3 patients recruited
  - No clinical differences noted between groups
- Baranauskaite et al – open label study
  - Mild PsA disease
  - MTX vs MTX + Infliximab
  - Good response to MTX in this group

MIPA: Methotrexate in Psoriatic Arthritis



Hepatotoxicity Concern
AAD:Liver Bx
- Low Risk Patients: 3.5 – 4.0g cum dose
- High Risk Patients: 1.0-1.5g cum dose

ACR: No recommendations

Acosta Felquer ML et al J Rheumatol. 2014 Nov;41(11):2277-85
Baranauskaite A et al Ann Rheum Dis. 2012 Apr;71(4):541-8.

MAYO CLINIC

Anti-TNF Therapies in PsA

- No Head to Head Studies
- Generally robust ACR 20/50/70 responses
- Methotrexate can reduce anti drug antibodies and raise levels fo adalimumab and infliximab
- Methotrexate may contribute to decreasing cardiovascular risk

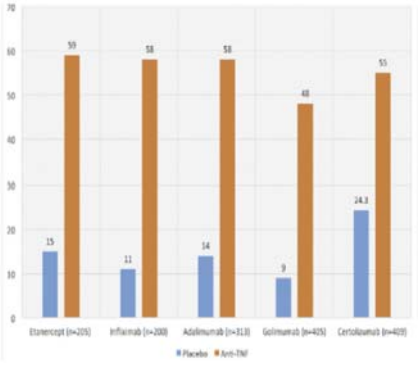
- Factors affecting choice of Anti-TNF therapies

  Antibody construct may be preferred for
  - Presence of concurrent Uveitis
  - Concurrent IBD
- Caution
  - Contra-indicated if melanoma present
  - Caution if previous squamous cell skin cancer

Boehncke WH et al 2014 Apr;170(4):772-86.

Anti-TNF Efficacy in PsA

- FDA Approved Dosing:
  - Adalimumab 40mg SC every other week
  - Etanercept 50mg SC every week
  - Golimumab 50 mg every month
  - Infliximab 5mg/kg 0,2,6 wks then q 8 wks
  - Certolizomab Pegol 400mg SC 0,2,4 wks then 200mg every 2 weeks or 400mg every 4 weeks



ACR 20 response rates. Trial results cannot be compared directly given differences in study populations and trial design.

Huynh D et al Rheumatology (Oxford). 2015 Jan;54(1):20-8
Paccou J et al, Joint Bone Spine. 2015 Mar;82(2):80-5.

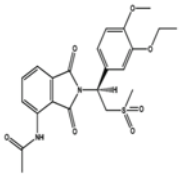
TABLE 1 Summary of results of clinical trials of TNFis in PsA

Agent/trial	Study size	Patients meeting reponse criteria, % ACR20	PASI75
Etanercept [38, 39]			
Week 12	205	59	38
Week 24		55	40
Week 48	169	64	40
Infliximab/IMPACT [40, 47, 48]			
Week 14	200	58	64
Week 24		54	60
Week 54	173	59	50
Week 98	104	62	64
ADA/ADEPT [41, 42]			
Week 12	315	58	49
Week 24		57	59
Week 48	245	59	59
Week 104		57	58
Golimumab/GO-REVEAL [43–45]			
50 mg			
Week 14	405	51	40
Week 24		52	56
Week 52	360	67	62
Week 104	335	67	86
100 mg			
Week 14		45	58
Week 24		61	66
Week 52	360	71	68
Week 104	335	70	86
Certolizumab/ rapid-PsA [46]	409		
200 mg			
Week 12		58	47
Week 24	138	64	62
400 mg			
Week 12		51	47
Week 24	135	56	61

TNFis: tumour necrosis factor inhibitors; ADA: adalimumab; ACR20: 20% response to ACR criteria; PASI75: Psoriasis Area and Severity Index 75.

Apremilast and PsA



- cAMP – key secondary messanger in many biological processes
- Regulated by degradation by phosphodiesterases(PDE)
- PDE4 expressed in hemapoetic, non-hemapoetic cells and sensory/memory neurons
- 4 PDE4 genes -> upto 19 geneproducts
- Apremilast binds to catalytic site of PDE4 (Less selective than cilomast, and no CNS SE like rolipram)
- Inhibition of T-Cell cytokine production
- Loading 6 day regime then 30mg bid
- Renal impairment – 30 mg qd

- Note
  - Main SE Nausea and Diarrhea
  - No structural data

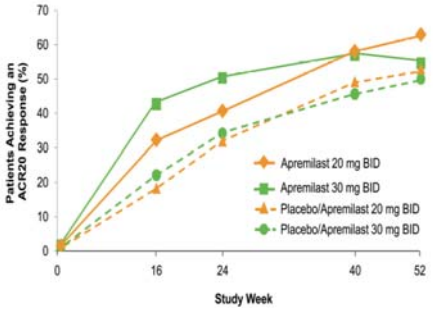


Figure: 52 Week Results Phase III Study

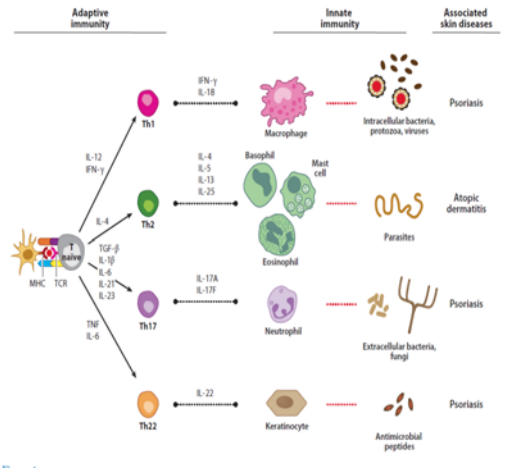
Schett G et al Ther Adv Musculoskelet Dis. 2010 Oct;2(5):271-8 Kavanaugh A et al J Rheumatol. 2015 Mar;42(3):479-88.

IL23/TH17 Axis – New Targets

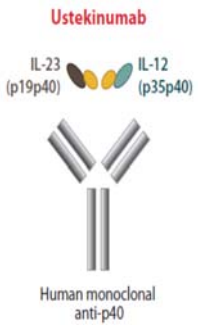
- IL23 secreted by monocytes, macrophages, skin dendritic cells
  - IL23p19 discovered in 2000
  - Needed to bind with IL12p40 to form hetrodimeric cytokine IL23
- IL23 assosciated with autoimmune disease – gene defects in exon 9 of IL23 R associated with protection against
  - Psoriasis
  - Crohns dis, UC, AS, GVH-D
  - Additional variants associated with RA, Psoriasis, Graves disease
- IL23 aids in proliferation of Th17 cells (Th17 is a potent pro-inflammatory cytokine)



Di Cesare A et al, J Invest Dermatol. 2009 Jun;129(6):1339-50.
Perera GK et al, Annu Rev Pathol. 2012;7:385-422.
Mease PJ, Curr Opin Rheumatol. 2015 Mar;27(2):127-33.

Ustekinumab for PsA

- Dose: Weight based for both Ps and PsA
  - Wt <100kg 45mg
  - Wt >100kg 90mg
  - Subcutaneous, baseline, 4 weeks, then 12 weekly thereafter
- Major Side Effects
  - Nasopharyngitis
  - Headaches
- Addition of MTX did not have synergistic effect (see next slide)



Mease PJ et al Drugs. 2014 Mar;74(4):423-41.

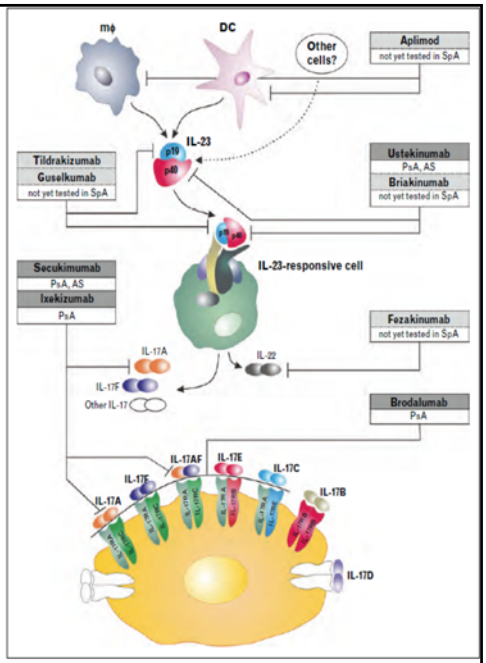
Ustekinumab for PsA

Outcome measure	Study	Concurrent therapy	Treatment groups				P-values
			Placebo		Ustekinumab 63 or 90 mg		
ACR 20 response	Gottlieb et al[25]	All patients	32/76 (42%)		10/70 (14%)		0.0002
			Placebo	Ustekinumab 45 mg	Ustekinumab 90 mg	Combined ustekinumab	
	McInnes et al[26]	All patients	47/206 (22.8%)	87/205 (42.4%)	101/204 (49.5%)	188/409 (46.0%)	<0.0001 for all comparisons versus placebo
		With MTX treatment	25/96 (26.0%)	43/99 (43.4%)	46/101 (45.5%)	89/200 (44.5%)	
		Without MTX treatment	22/110 (20.0%)	44/106 (41.5%)	55/103 (53.4%)	99/209 (47.4%)	
	Ritchlin et al[27]	All patients	21/104 (20.2%)	45/103 (43.7%)	46/105 (43.8%)	91/208 (43.8%)	<0.001 for all comparisons versus placebo
		With MTX treatment	14/49 (28.6%)	27/54 (50.0%)	21/52 (40.4%)	48/106 (45.3%)	
		Without MTX treatment	7/55 (12.7%)	18/49 (36.7%)	25/53 (47.2%)	43/102 (42.2%)	

Davari P et al Clin Cosmet Investig Dermatol. 2014;7:243-9.

Future Targets IL23/IL17 Axis

- 3 IL17 A inhibitors in development -PsA
  - Secukinumab
    - IL17A monoclonal Ab
    - Phase III trials reported at ACR for PsA
  - Ixekizumab
    - In Phase III
    - Did not show efficacy in Phase II RA trials
  - Brodaliumab
    - Human anti IL17A receptor
    - Phase II – two events of neutropenia
    - Not efficacious in RA
    - Not being persued in IBD

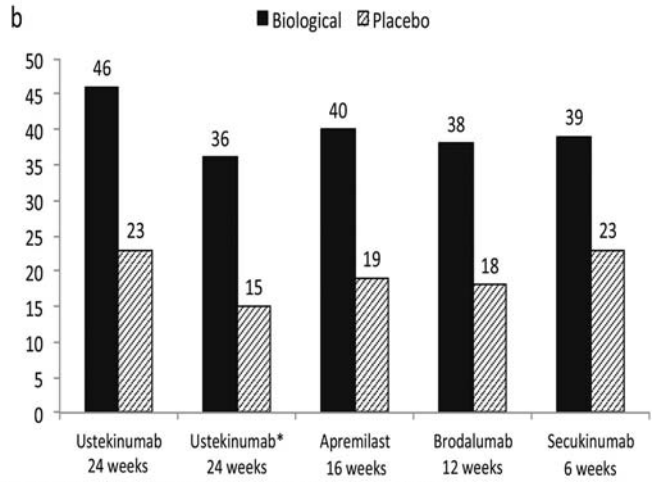


Yeremenko N, et al Curr Opin Rheumatol. 2014 Jul;26(4):361-70.
Mease PJ et al Drugs. 2014 Mar;74(4):423-41.

Different Biological Agents in PsA

ACR 20 Responses

DATA IS NOT HEAD TO HEAD



*Subgroup of PsA patients treated with ustekinumab that were TNFi inadequate responders (PSUMMIT-2 trial).
Results shown for apremilast are with the currently licenced dose of 30 mg BID.
Results shown for secukinumab were not statistically significant.

Filip Van den Bosch , Atul Deodhar. **Treatment of spondyloarthritis beyond TNF-alpha blockade**
Best Practice Research Clinical Rheumatology, Volume 28, Issue 5, 2014, 819 - 827

Conclusion

- Psoriatic disease is a multidimensional disease
- Multiple areas need to be evaluated including co-morbodities
- Several FDA therapies are available for treatment
- Newer targeted therapies are evolving

Return to Program Schedule

Spondyloarthritis

Clement Michet MD
Mayo Rochester

Disclosures

None

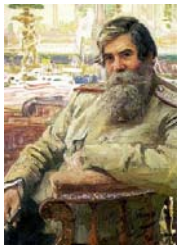
Return to Program Schedule

Objectives

- Describe the evolution of the concept of the spondyloarthritis disorders
- Describe inflammatory back pain and other early manifestations
- Review new imaging techniques for the diagnosis of spondyloarthritis
- Review new treatment strategies

MAYO CLINIC

Ankylosing Spondylitis
Early 20th Century Concept



MAYO CLINIC

Rheumatoid "Variants" "Rheumatoid Spondylitis"

Classical Variants

- Ankylosing spondylitis
- Psoriatic Arthritis
- Reactive Arthritis
- Arthritis of Inflammatory Bowel Disease

Unique Musculoskeletal Features

- Spine involvement
- Sacroiliitis
- Oligoarticular peripheral arthritis
- "Sausage digits"

MAYO CLINIC

Which One of These Conditions is the Most Common Spondyloarthritis You Encounter in Your Practice?

1. Ankylosing spondylitis
2. Psoriatic Arthritis
3. Reactive Arthritis
4. Arthritis of Inflammatory Bowel Disease
5. None of these

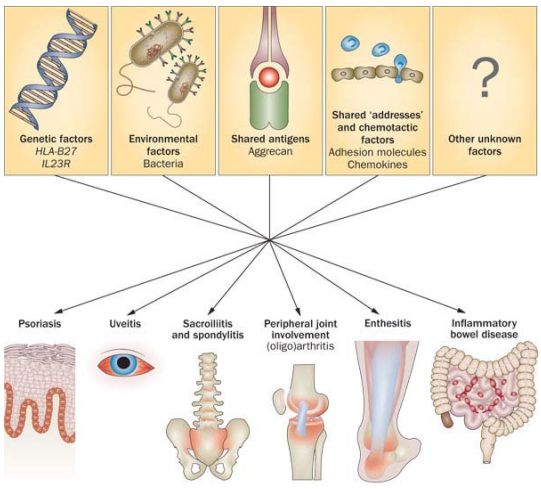
MAYO CLINIC

Discovery of HLA-B27
1973

- Demonstrated the strong genetic heritability of AS
  - > 90% positive
  - Prevalence of the disease is determined by the variation of HLA-B27 in different racial and ethnic groups
  - Associated with axial disease and uveitis
- HLA-B27 (-) patients tended to have more peripheral arthritis, psoriasis and IBD

MAYO CLINIC

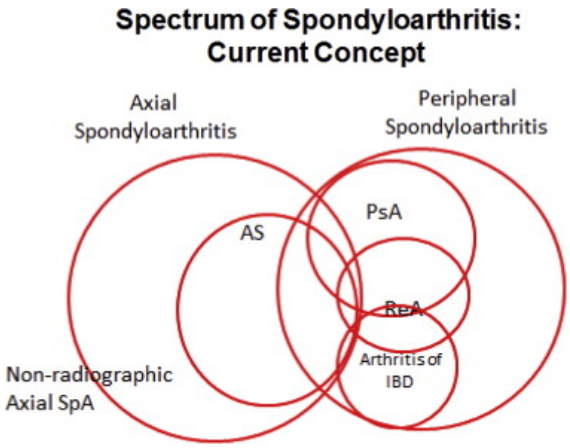
More than HLA-B27



MAYO CLINIC

Nature Rheumatology 2012

More than the Classical Four "Variants"



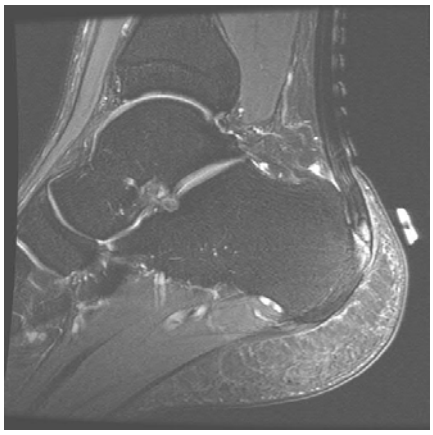
This spectrum is as common as rheumatoid arthritis!

Best Practices & Research Clinical Rheumatology 2014

How we think about early spondyloarthritis

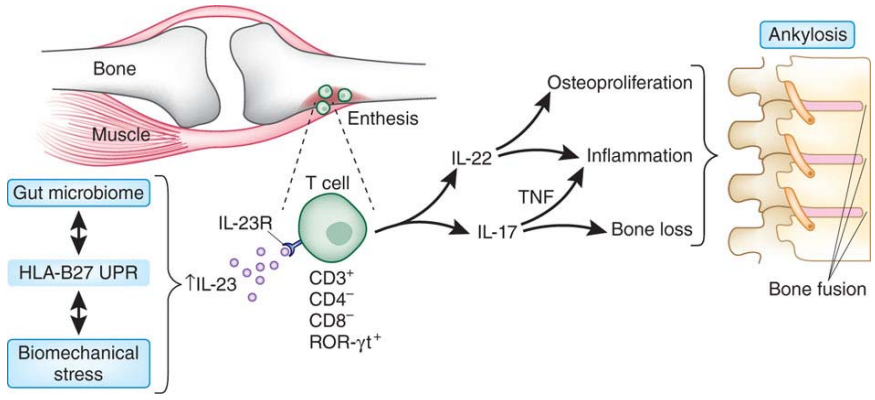
Persistent Achilles Enthesitis in a Young Athlete

- Refractory to usual treatments by trainer
- MRI reveals boney edema
- Mild wrist extensor tenosynovitis
- HLA-B27 positive
- Positive family history for IA in young cousin



Enthesitis

The Primary Target of Inflammation in Spondyloarthritis



Nature Med 2012

Clinical Differences SpA versus RA

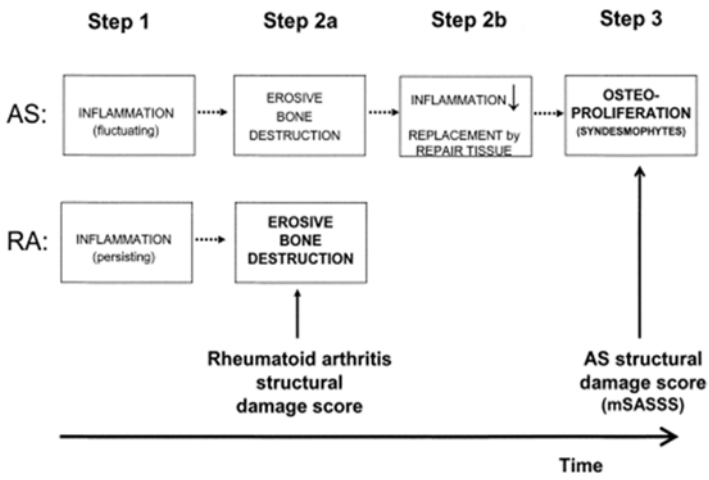
Spondyloarthritis

- Enthesitis, bone inflammation and bone formation
- Asymmetric oligoarticular peripheral arthritis LE>UE
- Rays of joints (dactylitis)
- Calcaneus, plantar fascia
- Axial involvement
  - **"Inflammatory LBP"**
  - Chest wall

Rheumatoid Arthritis

- Synovial disease, bone and cartilage loss
- Symmetric small joints
- Rows of joints – MCPs, MTPs
- "First step" morning metatarsalgia
- Atlantoaxial disease C1-2

New Bone Formation in the Spondyloarthritis Disorders

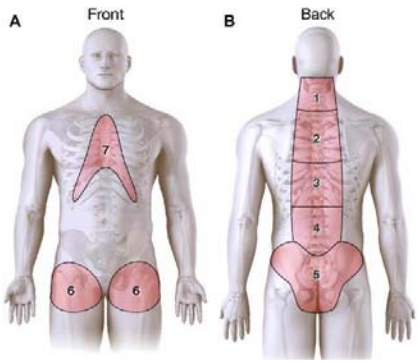


MAYO CLINIC

Inflammatory Back Pain

Characteristics

- Age of onset < 40 years
- Insidious onset
- Improvement with exercise
- No improvement with rest
- Pain at night, improved by getting up
- 4/5 best for Dx



Not just low back pain

MAYO CLINIC

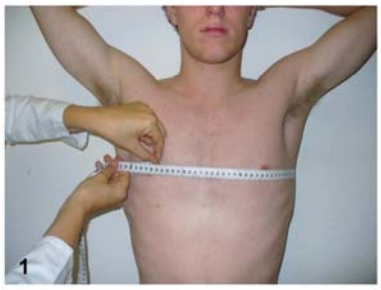
Spinal Mobility – Modified Schober

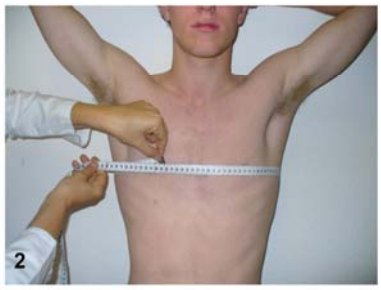
- Patient standing erect
- Mark an imaginary line connecting both posterior superior iliac spines (close to the dimples of Venus) (1)
- A next mark is placed 10 cm above (2)
- The patient bends forward maximally, measure the difference between the two marks (3)
- Report the increase (in cm to the nearest 0.1 cm)
- The best of two tries is recorded.

ASAS handbook, Ann Rheum Dis 2009; 68 (Suppl II) (with permission)

MAYO CLINIC

Spinal Mobility – Chest Expansion



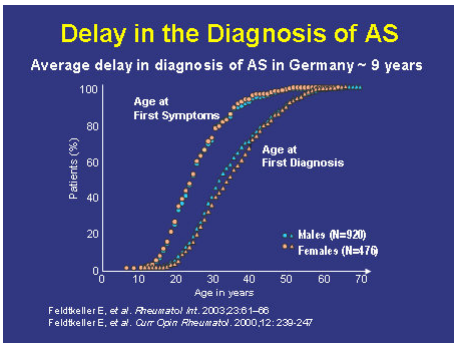


- Hands resting on - or behind the head
- Measure at 4th intercostal level anteriorly
- Difference between maximal inspiration (1) and exspiration (2) in cm (eg. 4.3 cm) is recorded
- Report the best of two tries

ASAS handbook, Ann Rheum Dis 2009; 68 (Suppl II) (with permission)

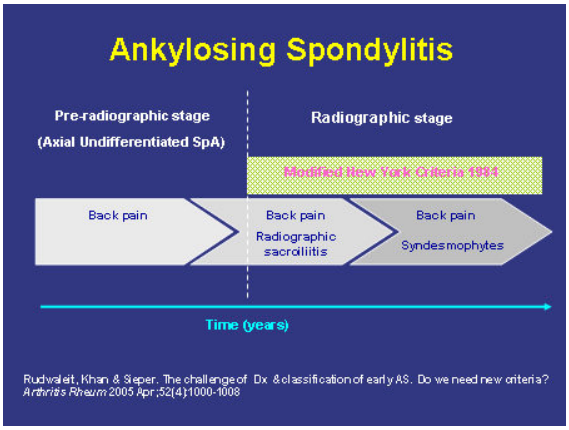
MAYO CLINIC

Symptoms frequently precede radiographic changes for years – the history is paramount!



MAYO CLINIC

Diagnosis of AS is delayed
Alternative ways of considering AS diagnosis?



MAYO CLINIC

Background Clues in Patients with IBP
An example of the importance of a good history

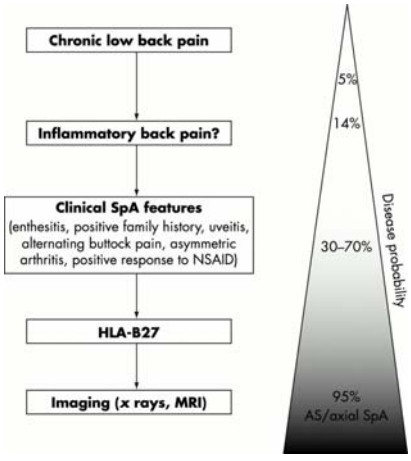
- Peripheral arthritis 24%
- Enthesopathy 28%
- Dactylitis 7%
- Anterior chest wall pain 19%
- Uveitis 4%
- Psoriasis 15%
- IBD 3%
- Family history of IA, Ps, IBD

MAYO CLINIC

Think About Non-Radiographic, Non-Axial Features to Make an Early Diagnosis

Non-Axial Manifestations

- Enthesitis
- Peripheral arthritis
- Anterior chest wall pain
- Psoriasis
- Dactylitis
- Uveitis
- IBD



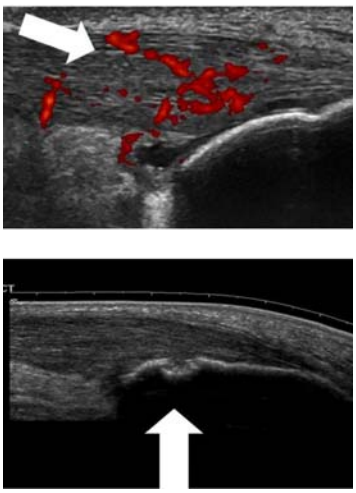
MAYO CLINIC

Spondyloarthritis Contemporary Diagnosis

- Less Emphasis on Radiographic Findings
- More Emphasis on Clinical Features
  - Non axial manifestations
  - Non-radiographic axial disease
- New Imaging Techniques
  - MRI for non-radiographic axial disease
  - US for enthesitis

MAYO CLINIC

Calcaneal Enthesitis On Ultrasound Exam



MAYO CLINIC

ASAS Criteria for Spondyloarthritis

ASAS Classification Criteria for Peripheral Spondyloarthritis (SpA)

Peripheral Arthritis and/or Enthesitis and/or Dactylitis
PLUS

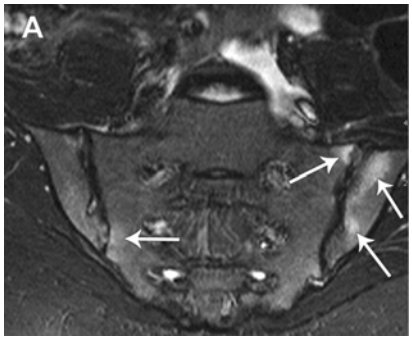
≥ 1 SpA feature	OR	≥ 2 other SpA features
• Uveitis • Psoriasis • Crohn's / colitis • Preceding infection • HLA-B27 • Sacroiliitis on imaging		• Arthritis • Enthesitis • Dactylitis • Inflammatory Back Pain (ever) • Family history of SpA

Sensitivity 77.8% Specificity 82.2%

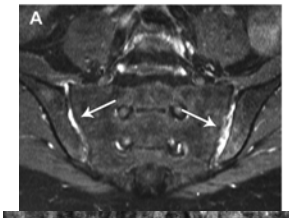
Rudwaleit M et al. Ann Rheum Dis 2011;70:25-31

MAYO CLINIC

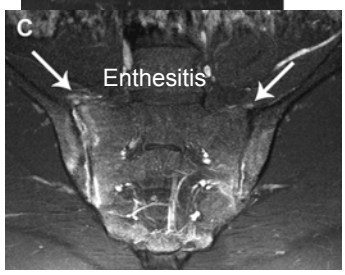
MRI Findings in Non-Radiographic Sacroiliitis



BONE EDEMA

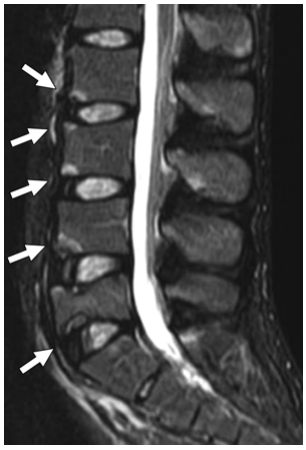


Synovitis



MAYO CLINIC

MRI Findings in Active Spondylitis



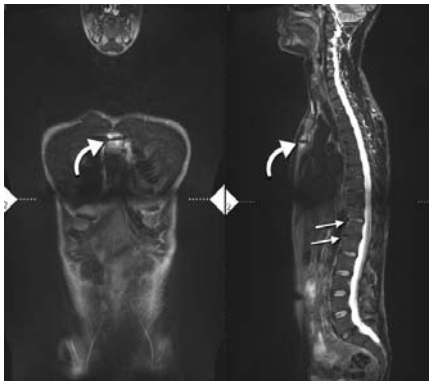
STIR weighted image

MRI Inflammation

- "Romanus" lesions
  - Inflammation at the edges of vertebral bodies
  - Enthesitis
    - Anterior longitudinal ligament
    - Posterior longitudinal ligament
  - Anterior corner inflammatory lesions (CILs) are the subject of most studies
- No need for gadolinium

MAYO CLINIC

Spotty Involvement in Early AS Documented by Whole Body MRI

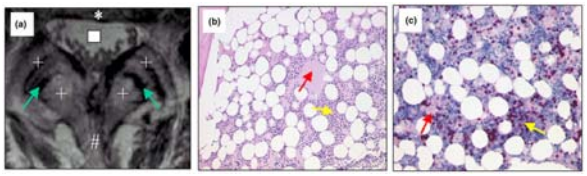


Chest Wall

MAYO CLINIC

False Negative MRI Study

Facet Imaging and Biopsy
No test is 100% sensitive



No inflammation CD3+ T cells with minimal edema

MAYO CLINIC

Arthritis Research & Therapy 2006

Radiological Diagnosis of Inflammatory Back Pain

- Conventional AP pelvis radiographs are more sensitive than MRI for detecting structural changes in the SI joint
  - Obliques views not routine
- MRI imaging with T2FS/STIR is more sensitive for detecting inflammation (bone edema)
  - Multiple lesions one slice or one lesion in more than one consecutive slices considered a positive scan
  - Gadolinium is rarely necessary
- Start with a pelvis x-ray and proceed only to MRI in persons with a negative film

MAYO CLINIC

Pelvis Film Negative, MRI Positive Patients

- The natural history of this subset of patients remains to be clarified
- Not all progress to structural changes, especially persons with unilateral inflammatory edema on MRI
- Severe bone edema and positive HLA-B27 may indicate greatest progression risk to AS (LR 8.0)

MAYO CLINIC

Case

- Your patient, a 45 year old woman with severe AS related to Crohn's Disease asks you to see her son for evaluation. He is 20 years old and is in a VoTech program for carpentry. He previously was very athletic but is now having a lot of pain in his back, neck and anterior chest. Pain is present every AM, responds partially to NSAIDS, improves during the day but disrupts his sleep.
- His exam is normal. He is HLA-B27 positive. Plain x-rays are all normal.
- Given his planned occupation what would you recommend?
  1. Send to PT and continue NSAIDS
  2. Consider other career options
  3. Discuss MRI scan of the SI joints and then see back for review

MAYO CLINIC

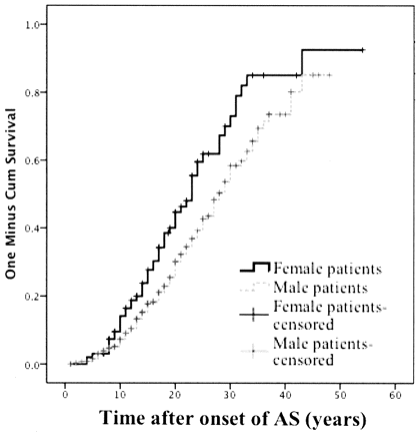
When would I put a patient through MRI evaluation?

Would it make a difference in your recommendations?

Counseling

Treatment

Spondyloarthritis Work Disability



Early polyarthritis and heart disease are significant risk factors for early disability

Non-manual work and the ability to self pace a work reduce the risk of work disability

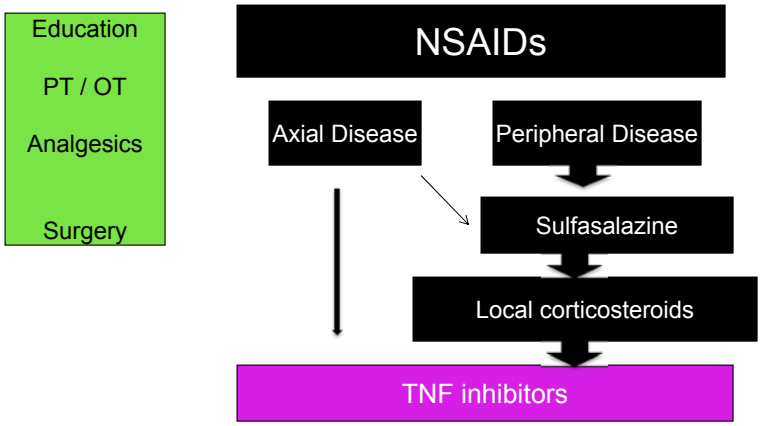
J Rheum 2011

Advantages to Imaging in Non-Radiographic Disease

- Confirm the diagnosis
- Avoid mislabeling and misdiagnosis
  - HLA- B27 positive mechanical back pain
  - HLA-B27 positive fibromyalgia
- Understand the limitations of imaging
  - False positive scans with bone edema
    - DJD
  - False negative scans

MAYO CLINIC

ASAS/EULAR Recommendations for Management of AS 2006



MAYO CLINIC

What can you expect from NSAID therapy?

- Over 70% of patients will derive some benefit
- But only 40% experience more than a 40% reduction in ASAS response
- Long term (2 years or more) continuous use may slow radiological progression in the subset of patients with syndesmophytes and elevated CRP
- At this point symptoms management is the primary indication for NSAID use in SpA
  - Consider GI and CV risks

MAYO CLINIC

NSAID Therapy in Spondylitis

Choosing NSAID Drugs

- There is no preferred agent based on efficacy
  - Symptom relief should be rapid but MRI reduction of inflammation is minimal (<20% demonstrate reduction)
  - Dose at maximum recommended for at least 4 weeks
- **Avoid** NSAIDs in patients with inflammatory bowel disease related spondylitis
  - Start with a low dose and only increase in a month if bowel symptoms don't flare (Celecoxib?)

MAYO CLINIC

TNF Inhibition in Spondylitis

- Who do we consider?
  - BASDAI > 4 and failure of 2 NSAIDs after 4 week trials
  - ASDAS ≥ 2.1 – less stringent
  - Refractory peripheral arthritis after trial of sulfasalazine or methotrexate
  - Hip joint synovitis
  - Refractory uveitis
- What to expect
  - Symptoms respond within a few weeks and plateau at 3 months
  - A minority (20%) of patients enter remission
  - Stop if no response in 8 weeks

MAYO CLINIC

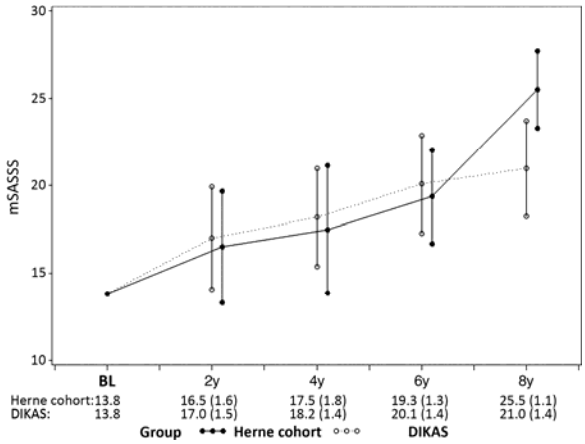
TNF Inhibition in Spondylitis

- Does the choice of product matter?
  - Monoclonal antibody for arthritis related to IBD
  - Monoclonal antibody for etanercept refractory uveitis
- What we don't know
  - Would early intervention with a TNFi slow boney proliferation?
  - Would treatment of non-radiographic AS prevent progression of the disease?

MAYO CLINIC

TNF Inhibitors are Not Curative

No Impact on Long term Structural Progression

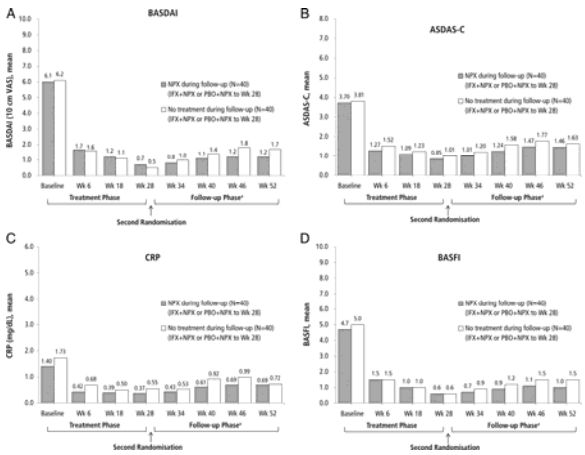


MAYO CLINIC

Annals Rheumatic Dis 2013

Can TNF Inhibitors be Used Short Term?

INFAST Study of Infliximab and Naproxen



MAYO CLINIC

Ann Rheum Dis 2014

Summary

- The spondyloarthritis disorders are more common than previously thought
- Inflammatory back pain is a key component for early identification of axial disease
- Consider a spondyloarthritis when seeing patients with iritis, plantar fasciitis, Achilles tendonitis or chest wall pain
- MRI has enabled early detection of axial disease
- The long term role of biologic therapy is still under investigation

MAYO CLINIC

Return to Program Schedule

Hip Pain

Thomas D. Rizzo, Jr., M. D.
Department of Physical Medicine and Rehabilitation
Mayo Clinic
Jacksonville, Florida

Mayo Clinic Rheumatology Update
April 18, 2015

Disclosures

- I will not speak about any off-label use of medications
- I do not receive payments from Big Pharma or Device Manufacturers
- I am still not beholden to The Man.

Return to Program Schedule

Objectives

- Discuss the evaluation of the patient's complaint of Hip Pain
- Present different scenarios that can be confused with hip joint pain
- Appreciate therapeutic interventions and the time frame for their efficacy

MAYO CLINIC

"LISTEN TO THE PATIENT. THEY ARE TRYING TO TELL YOU THE DIAGNOSIS."

Sir William Osler

MAYO CLINIC

“THE PATIENT DID NOT (NECESSARILY) GO TO MEDICAL SCHOOL. IT IS YOUR JOB TO MAKE THE DIAGNOSIS. SOMETIMES YOU HAVE TO LOOK AT THE PATIENT.”

Dr. Rizzo’s corollary

MAYO CLINIC

Case #1

50 something with “hip pain

Had seen multiple specialists

Negative hip x-rays

Frustrated by her condition

MAYO CLINIC

Case #1

Physical exam
Normal neuro-vascular exam
Normal hip, knee and Lumbar spine exam
Patient demonstrated location of her pain:

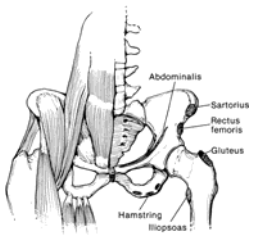
A test was performed

MAYO CLINIC

Case # 1

MAYO CLINIC

Normal ROM
Hip



Chapter 25 – Hip and Pelvis Stephen L. Nuccion, MD David M. Hunter, MD Gerald A.M. Finerman, MD in DeLee and Drez's Orthopaedic Sports Medicine, 2nd ed., Copyright © 2003 Saunders

MAYO CLINIC

Normal AROM
Hip

- Flexion 0-125 degrees
- Extension 0-15 (0-30)
- Abduction 0-45
- Adduction 45-0 (0-25)
- External Rotation 0-45 (0-60)
- Internal Rotation 0-45 (0-45)

MAYO CLINIC

Joint Evaluation
Hip

- Groin pain
- Short leg
- Externally rotated
- Pain with passive motion

www.learningradiology.com/.../cow213lg.jpg

Hip Area Injuries

- Hip joint pathology
  - History
  - Location
  - Exam
  - Pathology
    - Degenerative Joint Disease
    - Avascular Necrosis
    - Joint capsule pathology

Joint Evaluation Methods

Observation

- Let the patient demonstrate
- Compare side to side
- Take your time
- Mentally assess unaffected area to decrease exam time

http://www.youtube.com/watch?v=tcfGb6b2KWQ&NR=1

Joint Evaluation Methods

Manual Muscle Testing

- Reinforces what you see
- Make the patient comfortable
- Don't inflict pain yourself…at first
  - Patient demonstrate
  - Unaffected joint
  - Isometric testing
  - Hone in on the pathology
- Gain the advantage

MAYO CLINIC

Joint Evaluation Principles

Compare When Possible

- The patient has paired joints so you have a reference.
  - Requires you to know which one is normal
    - Fortunately, the patient can often tell you which is abnormal
- Symmetric disease poses a problem
  - Can compare to yourself…assuming you lack pathology

MAYO CLINIC

Joint Contractures

- A joint contracture is a limitation in the passive range of motion of a joint
  - Determine AFTER eliminating pain or spasticity
- Naming convention: Joint involved + Opposite the lack of range
  - Knee flexion contracture lacks full extension

From "Joint Contractures" by Campbell M, Dudek N, Trudel,G in Essentials of Physical Medicine and Rehabilitation, 3rd Ed, 2013 Elsevier, Frontera, Silver, Rizzo eds.

MAYO CLINIC

Joint Contractures

- Joint contractures
- Reasons for joint limitation:
  - Heterotopic ossification
    - Brain injury
    - SCI
  - Myositis ossificans
  - Fracture

MAYO CLINIC

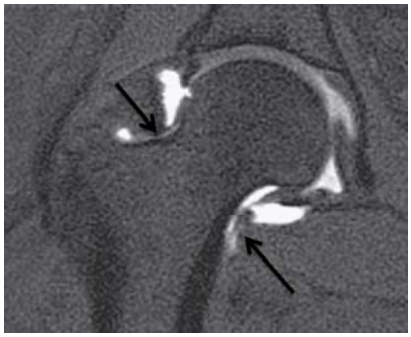
Adhesive Capsulitis of the Hip

- Gradual onset of stiffness
  - Limitation in crossing legs
  - Difficulty with activities requiring hip flexion
- Pain with extremes of External Rotation or Abduction

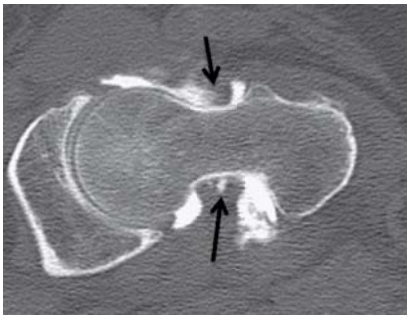
Frozen Hip

from PMcIntosh Adhesive Capsulitis of the Hip in Essentials of PM&R 3rd ed.

MRI arthrogram



CT arthrogram



Case #2

- 50 something referred for LBP
- History of smoking and Graves disease
- Family history of Ehlers-Danlos Syndrome (daughter)
- Exam positive for increased lumbar lordosis and painless decrease in hip motion

Low Back Pain

Flexibility

Strengthening

Pain Relief

Return to Function

Physical Therapy

- Pain Control
- Re-establish Motion/ Posture
- Improve strength
- Return to desired activities

Physical Therapy

- May be difficult but shouldn't be painful
- Post exercise discomfort for less than 2 hours
- Takes 2 months for significant change in strength
- If this is not working, consider re-assessment

Physical Therapy
Reasons it won't work

- Wrong Diagnosis
- Wrong Treatment
- Not long enough treatment
- Patient doesn't "get it"

Return to Program Schedule

Diagnostic Utility Musculoskeletal Ultrasound in Rheumatology

Gurjit S. Kaeley, MBBS, MRCP, FACR
Division Chief,
Associate Professor of Medicine,
Director of Musculoskeletal Ultrasound,
Division of Rheumatology,
University of Florida College of Medicine, Jacksonville, Florida

Disclosures

- **None**

Return to Program Schedule

Objectives

- **Upon completion of this session, participants should be able to:**
  - Explain how ultrasound assists in the assessment and management of regional pain syndromes
  - Describe the utility of ultrasound in Rheumatoid Arthritis and Spondyloarthropathies.
  - Recognize sonographic features of crystalline arthropathies

Ultrasound

Medical Ultrasound	1.0 - 20 MHz
Ultrasound	>20,000 Hz
Audible Sound	20Hz-20,000 Hz
Infrasound	0-20 Hz

Rheumatology 2004; 43: 931-933

MAYO CLINIC

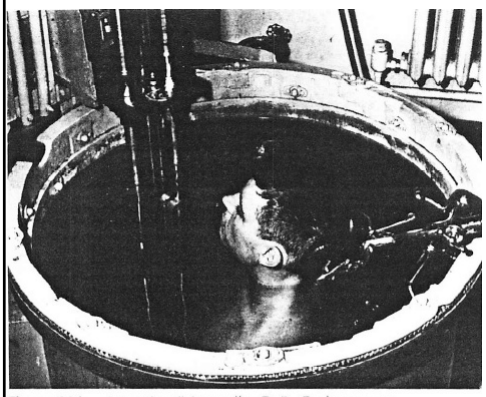

Figure 20A A "patient" (actually, C. R. Cushman, an electronic engineer working with Howry on the project) in position in the B-29 scanner, prepared for taking a scan of the neck. Lead weights on the patient's stomach ensured a consistent immersion level.

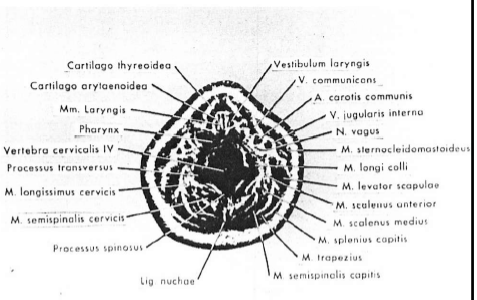

Figure 20B Cross-section of the neck of C. R. Cushman, made in the "gun-turret" scanner in 1956. Ten minutes were required to construct the image onto photographic film. The ability to image anatomical structure within the neck in such detail was a technical breakthrough for the Howry team. [Photograph courtesy of G. J. Posakony.]

Medical Diagnostic Ultrasound: Retrospective on its 40th Anniversary

MAYO CLINIC

Contemporary Ultrasound Machines

Why Rheumatologists Should Perform Musculoskeletal Ultrasound

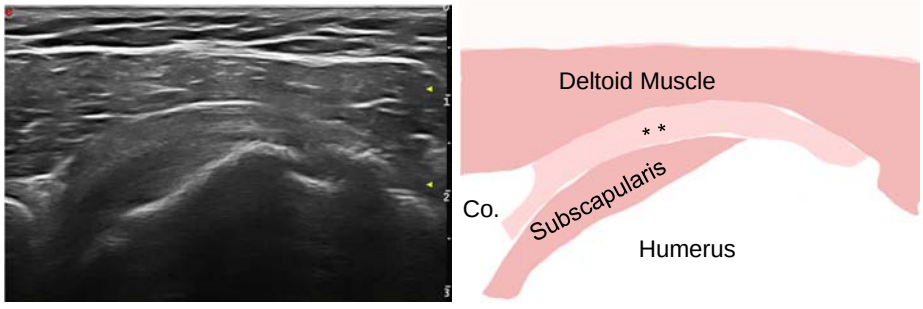
- Improve immediate diagnosis of joint and soft tissue disease ('extension of clinical examination')
- Early diagnosis of synovitis
- Early diagnosis of bone erosion and cartilage damage
- Objective monitoring of therapeutic response, disease status and outcome
- Improve interventional skills

Kane, D. et al. Rheumatology 2004 43:823-828; doi:10.1093/rheumatology/keh214

Indications For Musculoskeletal Ultrasound

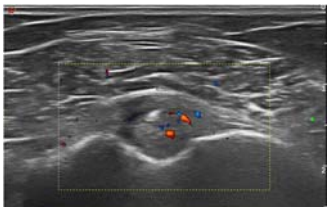
- Regional Pain
- Rheumatoid Arthritis
  - Damage
  - Synovitis
  - Extra-articular structures
- Spondyloarthropathy
- Crystalline Arthropathies
- Ultrasound Guidance for Procedures

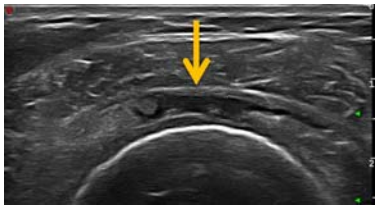
Regional Pain: Shoulder Pain

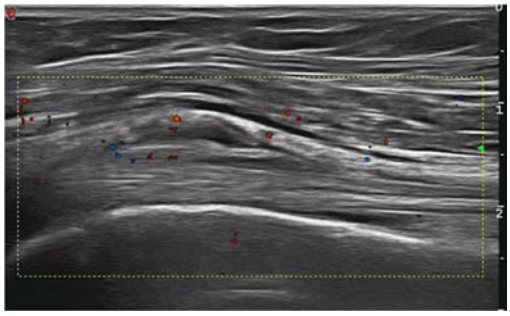


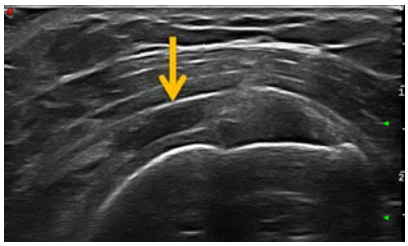
Dynamic testing reveals presence of subcoracoid/subdeltoid bursitis (**)

Regional Pain: Shoulder Pain









Supraspinatus Tear

Bicipital Tenosynovitis

Regional Pain: Lateral Wrist Pain

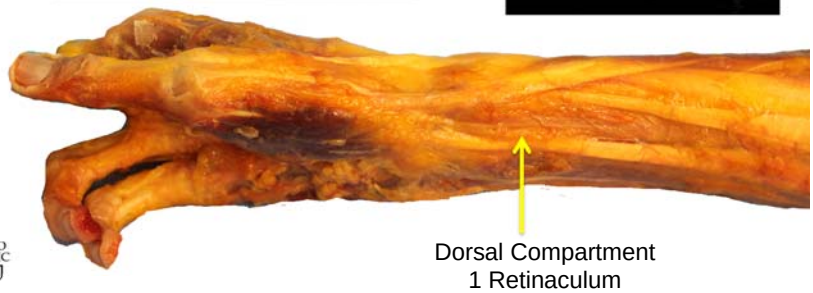
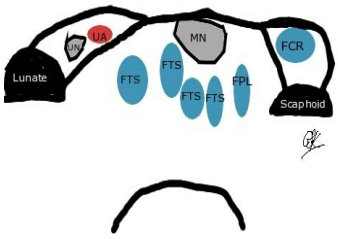
DR F DE QUERVAIN OF BASEL

First published: Muenchener Medizinische Wochenschrift 1912, 59, 5–6

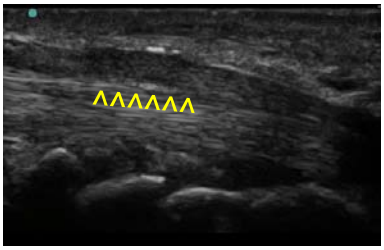


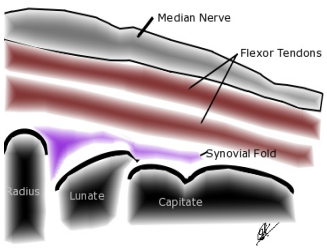
Dorsal Compartment
1 Retinaculum

Carpal Tunnel Syndrome



Edema and Pre-stenotic Dilation of Median Nerve





Indications For Musculoskeletal Ultrasound

- Regional Pain
- Rheumatoid Arthritis
  - Damage
  - Synovitis
  - Extra-articular structures
- Spondyloarthropathy
- Crystalline Arthopathies
- Ultrasound Guidance for Procedures

MAYO CLINIC

How Does Ultrasound Help in the Diagnosis of Inflammatory Arthritis?

MAYO CLINIC

When to Consider US in RA

ERA

Diagnosis: confirm synovitis

Prognosticate: Doppler Activity and Erosion detection (Information may guide aggressiveness of therapy)

LDA **MDA** **HDA**

Established RA

Confirm Doppler remission

Consider when additional evidence for ongoing synovitis or damage is needed to escalate or de-escalate therapy

Consider when there is discrepancy between physician and patient global tender and swollen joint counts

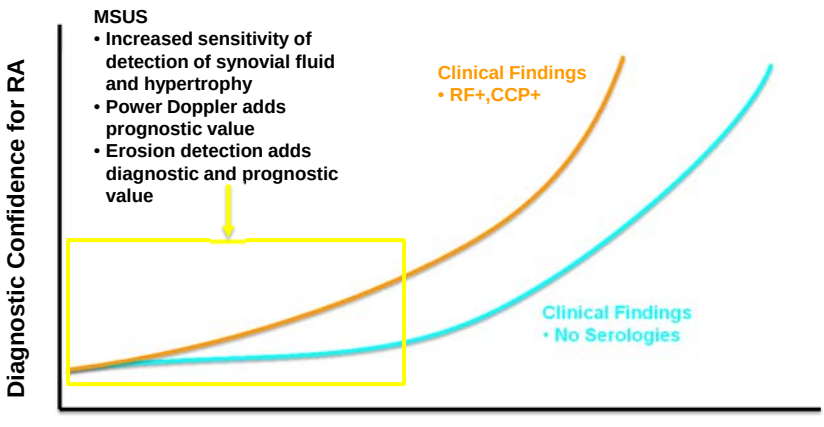
Consider for evaluation of symptomatic areas where clinical exam is not clear, eg, at shoulders, elbows, hips, ankles and feet

MAYO CLINIC

LDA = low disease activity; MDA = moderate disease activity; HDA = high disease activity

Written communication: Gurjit Kaeley, MD, October 2013.

Use of Sonography in ERA



MAYO CLINIC

RF = rheumatoid factor
CCP = anticyclic citrullinated peptide

Personal Communication Gurjit S Kaeley Oct 2013
Colebatch AN et al. *Ann Rheum Dis*. 2013;72(6):804.

MSUS – Role in Diagnosis of Early Inflammatory Arthritis

- Prognostication?
  - In patients seronegative for RF, CCP, baseline sonographic findings of synovial hypertrophy, PD, and erosions predicted a diagnosis of Inflammatory arthritis at one year.
  - Van Stadt et al – patients seropositive for RF and or CCP – B-mode synovitis and PD predicted future inflammatory arthritis at the joint level.

MAYO CLINIC

Freeston JE et al Annals of the rheumatic diseases 2009:ard.2008.106658.
van de Stadt LA *et al.. Arthritis research & therapy 2010; 12:R98*

Use of MSUS in RA: Joint Assessment

- Disease activity evaluation
  - Estimation of joint destruction
    - Cartilage degradation
    - Erosion detection
  - Estimation of ongoing activity
    - Synovial hypertrophy and fluid
    - Activity of synovial hypertrophy inferred by estimating blood flow – doppler techniques

HEALTH SYSTEM

Behçet's (Syndrome) Disease

Kenneth T. Calamia, M.D.
calamia@mayo.edu

Disclosure

- Research support: Celgene

There are no approved agents for the treatment of Behçet's Disease.

- This presentation will contain discussion of unapproved agents in the treatment of Behçet's disease.

MAYO CLINIC
HEALTH SYSTEM

Return to Program Schedule

Learning Objectives

- Recognize the clinical manifestations of BD in the USA and understand differences from those from the Silk Road.
- Identify other disorders with mucocutaneous and ocular manifestations that may mimic Behçet's Disease.
- Recommend empiric and evidence-based treatments for Behçet's Disease.

MAYO CLINIC HEALTH SYSTEM

Morbus Behçet

- Hippocrates; Adamantiades (1931)
- H. Behçet (1937)
  - oral ulcers
  - genital ulcers
  - hypopyon-uveitis
- Distinctive multisystem vasculitis
  - large and small vessels
  - arteries and veins
- "silk road" but worldwide in distribution

MAYO CLINIC HEALTH SYSTEM

Behçet's Disease
International Study Group Criteria

- recurrent oral ulceration (3x/yr)

  plus 2 of the following:
- recurrent genital ulceration
- eye lesions
- skin lesions

  EN, pseudofolliculitis, papulopustules, acneform
- positive pathergy test

MAYO CLINIC HEALTH SYSTEM

Lancet,1990

Behçet's Disease in US
Sensitivity of "Diagnostic" Criteria

	Total group n=164 (%)	With pathergy test n=27 (%)	No pathergy n=137 (%)
Mason & Barnes	77.4 ± 6.4	70.4 ± 17.2	78.8 ± 6.8
O'Duffy	88.4 ± 4.9	88.9 ± 11.9	88.3 ± 5.4
Dilsen	82.4 ± 5.8	77.8 ± 15.7	82.5 ± 6.4
Japan	84.8 ± 5.5	70.4 ± 17.2	86.9 ± 5.7
ISG	75.6 ± 6.6	77.8 ± 15.7	74.5 ± 7.3
Iran (traditional)	82.9 ± 5.8	77.8 ± 15.7	83.2 ± 6.3
Classification Tree	91.5 ± 4.3*	88.9 ± 11.9	91.2 ± 4.7

(* p=0.001)

MAYO CLINIC HEALTH SYSTEM

Calamia, Davatchi, 2000

Behçet's Disease
ISG criteria

- The diagnosis of BS is clinical
- The clinician should consider other manifestations of the disease
  - large vessel disease
  - meningoencephalitis
  - arthritis, gastrointestinal disease

especially in Western countries

where pathergy is less common & pathergy testing is less often performed

MAYO CLINIC HEALTH SYSTEM

Schirmer, Calamia, O'Duffy, 1999

Behçet's Disease
New International Criteria for Behçet's Disease (ICBD)

ICBD scoring: score ≥ 4 indicates BD

Symptom	Points
Ocular lesions	2
Oral aphthosis	2
Genital aphthosis	2
Skin lesions	1
Central nervous system	1
Vascular manifestations	1
Positive pathergy test*	1

*Though the main scoring system does not include pathergy test, where pathergy testing *is* conducted, a positive result may be included for one extra point.

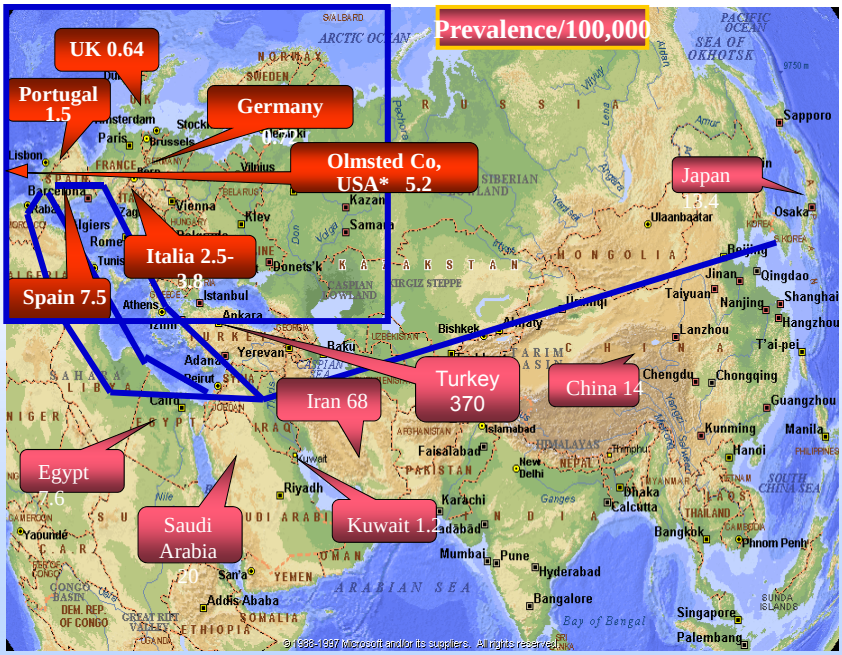
Distribution of scores in cases and controls

Score*	% cases	% controls	Plausibility of BD	Classification
≤1	<1%	11%	Highly unlikely	No BD
2	1%	72%	Very unlikely	
3	4%	9%	Possible	
4	14%	5%	Probable	BD
5	32%	3%	Highly probable	
≥6	48%	<1%	Almost certain	

*This table does not incorporate any pathergy test results

MAYO CLINIC HEALTH SYSTEM

International Team for Revision , International Congress on BD, London, 2010



MAYO CLINIC HEALTH SYSTEM

*Calamia, Arthritis Care & Res, 2009

Behçet's Disease
Regional Differences

Silk Road	America & W. Europe
Men ≥ Women	Women > Men
Intractable eye disease	Treatable eye disease
CNS ≤ 10%	CNS ≥ 20%
HLA-B51 in 50-80%	HLA-B51 in 15%
Regional differences	HLA-DRB1*04

MAYO CLINIC HEALTH SYSTEM

Behçet's Disease
Regional Differences

GI disease	~30-50% in Far East
Vascular	40% Middle East, 5-10% Far East
Aortic Valve	Mainly Far East
Endomyocardial	Mainly in France

MAYO CLINIC HEALTH SYSTEM

Behçet's Syndrome

The cause of the disorder is unknown

There is no "gold-standard" for the Dx

There are sporadic, non-silk road cases

- lack genetic and ancestral similarities
- mucocutaneous syndromic presentations
- milder, females
- often attributed to other entities:

  CUC, Crohn's, Reiter's, SLE

MAYO CLINIC HEALTH SYSTEM

Behçet's Syndrome or ?

- The importance of the diagnosis of Behçet is related to the presence or risk of uveitis, CNS disease, and vascular manifestations
- Younger patients and males are at greatest risk of complications
- In patients at low risk, with mucocutaneous disease, it may be appropriate to avoid diagnosis of BD

MAYO CLINIC HEALTH SYSTEM

Behçet's Disease
Epidemiology

- prevalence
  - 100-370/100,000 Turkey and Iran
    - Lower rates for ethnic Armenians in Istanbul
  - 13-17/100,000 Japan, Korea, China
    - very low rates in Japanese-Americans
  - 0.3-7.5/100,000 Europe and USA
    - higher in German Turks, but < than in Turkey

MAYO CLINIC HEALTH SYSTEM

Environmental Agents Implicated in BD

- Viruses, esp HSV
- Bacteria
  - Streptococci: tonsillitis, dental caries
  - Acneform lesions not sterile
    - Familial clustering of acne/arthritis
  - Therapeutic effect of antibiotics
- BD assoc/w ↓ socio-econ status in Turkey
- ↓ in incidence & severity of BD in Japan
  - c/w ↑ atopic diseases (↑Th 2)
  - c/w ↓ in dental infections

MAYO CLINIC HEALTH SYSTEM

Direskeneli, Clin & Experimental Rheumatology, 2010

BD: A Seronegative Spondyloarthropathy?

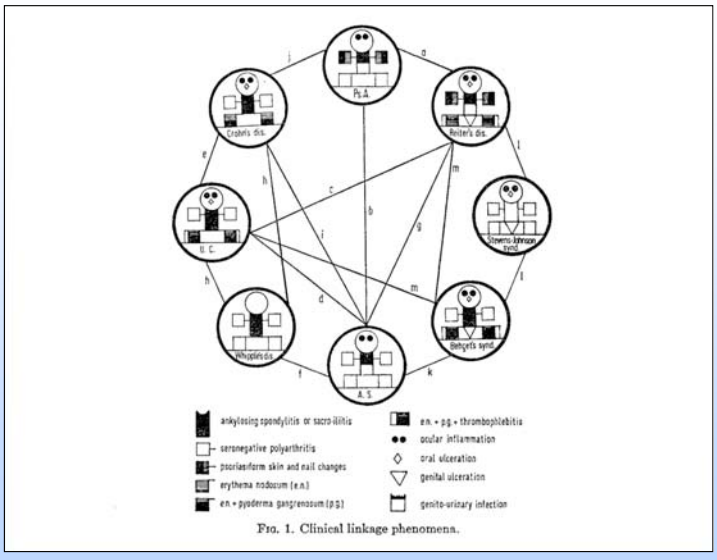


FIG. 1. Clinical linkage phenomena.

MAYO CLINIC HEALTH SYSTEM

Moll, *Medicine*, 1974

BD: an autoimmune disease?

- No evidence of B or T cell hyperreactivity or transfer by Ab or pathogenic T cells
- Female predilection
- No immune cytopenias, Raynaud's, Sjogren's, vitiligo, nephritis, neuropathy
- No premature atherosclerosis
- Skin and mucosal disease distinct
- Cessation of disease activity over time in BD

MAYO CLINIC HEALTH SYSTEM

BD: an autoinflammatory disease?

- Apparently unprovoked inflammatory episodes
- Innate immunity abnormalities
- Several differences between BD and classic autoinflammatory disorders:
  - Polygenetic
  - Family history only present in about 10%
  - Age of onset in 2nd-4th decades
  - Uveitis different

MAYO CLINIC HEALTH SYSTEM

Different organ responses to Rx in BD

- Thalidomide ↓ skin/mucosa ↑EN
- Colchicine ↓ EN and arthritis
- Etanercept ↓ skin/mucosa, no pathergy effect
- Gevokizumab (IL 1-β blocker) ↓ eye disease, not for ulcers
- Tocilizumab ↓ eye disease, not for ulcers

Suggests >1 inflammatory pathway

MAYO CLINIC HEALTH SYSTEM

Yazici, *Clin Rev Allerg Immunol*, 2012

Pathergy

- Unique to Behcet's Disease
- Hyperactive neutrophils after trauma
- Tested for by needle prick
- More common along Silk Road
- Not common in the USA
- Testing not commonly done, but easy to perform:
  - 3 sticks with sterile 20g needle
  - "read" at 48 hours

MAYO CLINIC HEALTH SYSTEM

from Hamuryudan

MAYO CLINIC HEALTH SYSTEM

Pathergy Equivalents

from Onder, 2004

Skin reaction, thrombosis after venipuncture
Flare of uveitis after cataract surgery
Flare of arthritis after arthrocentesis or carpal tunnel release
Bumps after acupuncture or EMG
Aneurysm formation after arterial puncture

MAYO CLINIC HEALTH SYSTEM

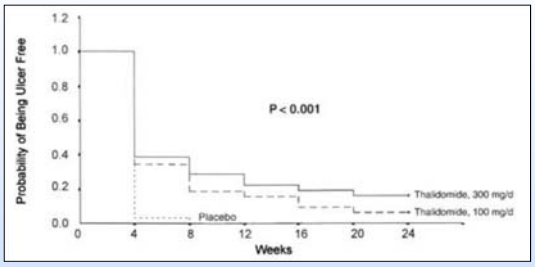
Thalidomide in BD



Males only
Neurotoxicity- 6%

Yazici, Ann Intern Med, 1998

"Grand-round cases divert us from the humdrum of everyday practice, but diagnostic eurekas must be tempered by therapeutic sobriety. Let us not kill a potentially useful drug, given a second chance, by injudicious prescribing."

Ehrlich, Ann Intern Med, 1998

MAYO CLINIC HEALTH SYSTEM

Use of anti-TNF agents in ocular BD

- Meta-analysis (369 pts)- 90% response rate in pts inadequately controlled by conventional Rx
- With F/U 16-36 mo- INFlix effects sustained, relapse rates <50% of baseline, stabilization of VA
- Fewer exacerbations INFlix (0.4/yr) compared to CSA (1.2/yr) in retrospective studies (3/yr baseline)
- 67.7% of 124 refractory patients inactive at 1 year
- Retinal vasculitis: lower relapse rate & VA with INFlix compared to standard Rx (mean F/U 36 mo)

Arida, 2011; Levy-Clarke, 2014; Yamada, 2010, 2011; Calvo-Rio, 2014 Tabbara, 2008

MAYO CLINIC HEALTH SYSTEM

INF-α in posterior or panuveitis in BD

- Multiple open studies since 2003
- Effective in >90% of patients refractory to steroids, AZA and CSA
- Evolving experience with lower doses, 3MU tiw
- Do not use with AZA because of myelosuppression risk

MAYO CLINIC HEALTH SYSTEM

Gevokizumab (Xoma 052) in Behçet's Uveitis

- IL-1B inhibitor
- Orphan drug designation after a phase 2 trial of a single dose IV gevokizumab (0.3 mg/kg), in 7 patients with Behçet's uveitis.
  - All patients experienced complete reduction of inflammation, median of 14 days.
  - Duration of response 49 days, median
  - 5 patients with recurrent oral ulcers & folliculitis experienced recurrences during the study

MAYO CLINIC HEALTH SYSTEM

Gul, *Ann Rheum Dis*, 2012

EULAR recommendations for the management of Behcet's disease

- **The management of DVT in BD should include IS agents: steroids, AZA, CTX or CSA.**
- **There is no evidence of benefit from anticoagulants in the management of DVT**
  - ***Beware of coexisting pulmonary art. aneurysms!***
- **CTX & steroids recommended for pulmonary & peripheral arterial aneurysms**
  - ***Embolization for PAAs, surgical mortality ↑***
  - ***Surgery for peripheral or AAA***

MAYO CLINIC HEALTH SYSTEM

Hatemi, *Ann Rheum Dis, 2008; 67:1656-62*

Other biologic agents in Rx of BD

44 BD cases Rx'd with non anti-TNF biologics:

- 24 patients on IL-1 inhibitors:
  - 13- anakinra; 4- canakinumab ; 7- gevokizumab
- 7 patients treated with the IL-6 RA tocilizumab
- 1 pt.- anti-IL-12/23R agent ustekinumab
- 12 pts.- anti-CD-20 agent rituximab

Secukinumab (anti-IL-17), N=118 & Daclizumab (anti-IL-2 RAb), N=17 not superior to placebo for ocular BD in controlled trials

Apremilast for Behçet's Syndrome — A Phase 2, Placebo-Controlled Study

Gulen Hatemi, M.D., Melike Melikoglu, M.D., Recep Tunc, M.D., Cengiz Korkmaz, M.D., Banu Turgut Ozturk, M.D., Cem Mat, M.D., Peter A. Merkel, M.D., Kenneth T. Calamia, M.D., Ziqi Liu, Ph.D., Lilia Pineda, M.D., Randall M. Stevens, M.D., Hasan Yazici, M.D., and Yusuf Yazici, M.D.

MAYO CLINIC HEALTH SYSTEM

April 16, 2015

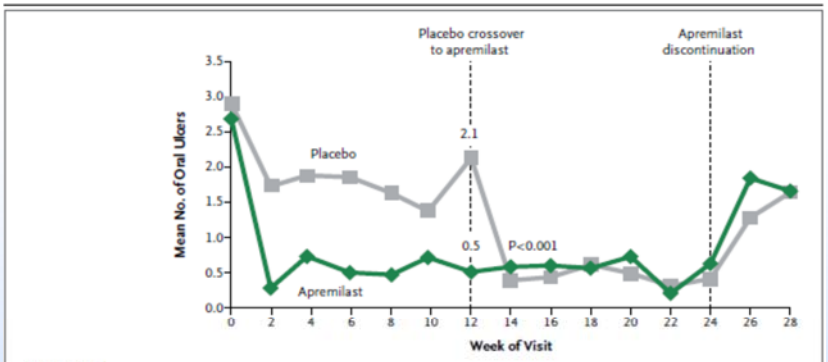
Apremilast in Behçet's Syndrome

Apremilast- PDE-4 inhibitor, ↑ intracellular cAMP
↓ TNF-α, interleukin-23, interferon-γ
↑ interleukin-10

- Phase 2, multicenter, placebo controlled study
- 111 patients with BD ulcers
- Apremilast 30 mg BID vs placebo x 12 weeks
- 1º endpoint- # ulcers at week 12
- 2º endpoints- pain, genital ulcers, dis.activity, QoL

MAYO CLINIC HEALTH SYSTEM

Hatemi, *New Eng J Med*, 2015



No. at Risk															
Placebo	56	56	53	51	44	42	45	45	36	45	36	34	45	38	54
Apremilast, 30 mg	55	55	50	53	48	47	50	49	41	49	38	37	47	40	54
Mean No. of Oral Ulcers															
Placebo	2.9	1.7	1.9	1.9	1.6	1.4	2.1	0.4	0.4	0.6	0.5	0.3	0.4	1.3	1.6
Apremilast, 30 mg	2.7	0.3	0.7	0.5	0.5	0.7	0.5	0.6	0.6	0.6	0.7	0.2	0.6	1.9	1.7

Figure 1. Mean Number of Oral Ulcers Per Patient, According to Study Group.
The mean number of oral ulcers per patient was significantly lower in the apremilast group than in the placebo group during the placebo-controlled phase (baseline to week 12). At week 12, patients in the placebo group were switched to apremilast therapy, after which the mean number of oral ulcers in those patients decreased. After apremilast was discontinued at week 24, the mean number of oral ulcers started to increase within 2 weeks. A repeated-measures analysis performed with data from baseline to week 12 showed consistent results.

Periodic Fever Disorders

Rheumatology Update 2015

L.e. Mertz MD
Rheumatology Division
Mayo clinic Arizona

Disclosure Statement

There are no financial conflicts to disclose.

Return to Program Schedule

Goals of Presentation

- Review basic pathophysiology of fever in humans.
- Identify several genetic disorders that lead to Autoinflammatory/Periodic Fever disorders.
- Demonstrate how knowledge of genetic causes of fever may apply to understanding gout and recurrent pericarditis.
- Identify resources available for understanding the genetics of Periodic Fever disorders and obtaining genetic testing confirmation.

MAYO CLINIC

Potential Etiologies of Fever

- Infection
- Malignancy
- Drugs
- CNS hemorrhage or irritation
- Autoimmune disorders
  - Vasculitis, SLE, Still's disease.
- Autoinflammatory
  - Periodic Fever disorders
    - Familial Mediterranean Fever
    - TRAPS-TNF Receptor Associated Periodic Syndrome
    - CAPS-Cryopyrin Associated Periodic Syndromes.
    - Mevalonate kinase deficiency.
  - Non-Periodic Fever Disorders
    - Crohn's disease, Sarcoidosis. others.
- Crystal induce arthritis
  - Gout, Pseudogout.

MAYO CLINIC

- Malignancy
- Drugs
- CNS hemorrhage or irritation
- Autoimmune disorders
  - Vasculitis, SLE, Still's disease.
- Autoinflammatory
  - Periodic Fever disorders
    - Familial Mediterranean Fever
    - TRAPS-TNF Receptor Associated Periodic Syndrome
    - CAPS-Cryopyrin Associated Periodic Syndromes.
    - Mevalonate kinase deficiency.
  - Non-Periodic Fever Disorders
    - Crohn's disease, Sarcoidosis, others.
- Crystal induce arthritis
  - Gout, Pseudogout.

MAYO CLINIC

Autoinflammatory Disorder

Characteristics

- Inflammation by symptoms, findings, laboratory tests, x-rays or biopsy.
- Episodic, less often periodic.
- Unprovoked by usual causes(infection, malignancy, etc).
  - Occasionally associated with apparently benign physical(cold, vaccination) or emotional stress
- Lack of significant auto antibody production by B cells (SLE, ANCA).
- Lack of antigen specific, activated T cells (viral illness).
- Often associated with fever, leukocytosis, rash, arthralgia, myalgia.
- Laboratory evidence of inflammation: elevated ESR and CRP.
- Due to inappropriate activation of the innate immune system through antigen independent inflammatory mechanisms.

MAYO CLINIC

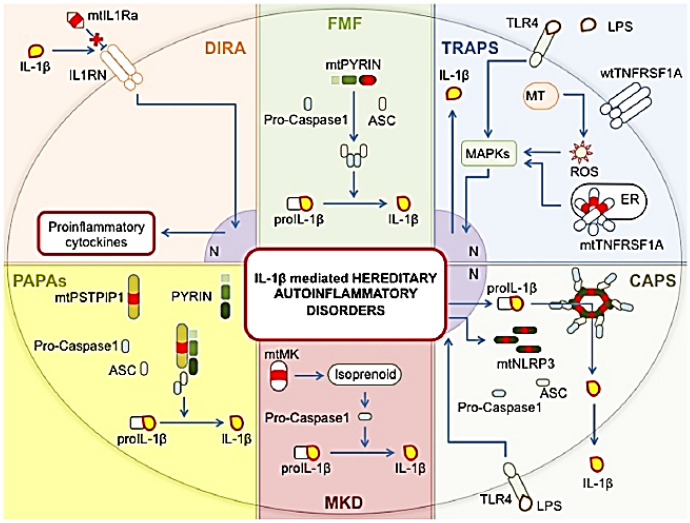
D. Rigante et al. / Autoimmunity Reviews 13 (2014) 892–900



MAYO CLINIC

Familial Mediterranean Fever

- Commonly affected populations.
  - Turks
  - Armenians
  - Arabs
  - Non-Ashkenazie Jews
- Countries with reported cases
  - Mediterranean basin
  - North Africa
  - USA
  - Europe
  - Australia
  - Japan

MAYO CLINIC

Clinical Case 11/23/2011

- 32 year old woman of Jordanian descent presents for follow up of Familial Mediterranean Fever (FMF) present since 3 months of age.
- Episodes of spontaneous fever, chest and abdominal pain, fatigue lasting approximately 3 days.
- Questions of tonsillitis and appendicitis lead to surgical removal without long term benefit.
- Episodes treated with bed rest until resolution.
- Colchicine 1 mg BIW started 4 years ago with complete resolution of episodes without med side effects.

MAYO CLINIC

Clinical Case 11/23/2011

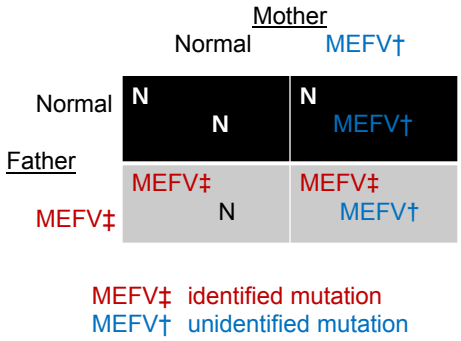
- Genetic Testing 8/19/2011 (ARUP Lab)
  - Only one pathogenic mutation detected in the MEFV gene.
  - This individual is a carrier of FMF.
  - MEFV mutation analysis
    - Mutation present in exon 10
    - Nucleic acid change: c.2080 A>G heterozygous.
    - Amino acid alteration: pMeth694Val
    - Analytic sensitivity 99%.
    - Clinical sensitivity 80%
    - Most highly associated with amyloidosis.

Clinical Case 11/23/2011

- Genetic Testing 8/19/2011.
  - Autosomal recessive inheritance(two abn. genes required).
  - Mutations in the MEFV gene are known to cause FMF. However, other genes may be involved as some affected patients do not have <u>any</u> identifiable MEFV gene mutations.
  - Affected individuals are usually <u>compound heterozygous</u> and carry <u>two</u> distinct MEFV gene mutations.
  - Approximately 80 MEFV gene mutations have been reported; the majority are in exon 10.

Clinical Case 11/23/2011

- Family history
  - Both parents reportedly asymptomatic.
  - 1/1 brother has FMF on colchicine.
  - 1/3 sisters has FMF on colchicine.
  - Consistent with autosomal recessive inheritance pattern.



MEFV‡ identified mutation
MEFV† unidentified mutation

Clinical Case: 2/14/2011

- 64 year old woman ill since 1 year of age.

"My Rheumatologist wants to know what I have".

- Dermatologic
  - Episodic, erythematous, painful macules of trunk.
  - Duration 7-10 days, weeks between, no visible sequellae.
  - Worsening of chronic fatigue and anorexia during episodes.
  - Bx: perivascular inflammation. Vasculitis questioned.
- Gastroenterologic
  - Episodic abdominal pain like "a towel twisted in abdomen".
  - Distant liver bx: minimal non-specific hepatitis.
- Musculoskeletal
  - Variable but daily proximal muscle soreness. Never joint swelling.
  - Distant muscle biopsy negative.

Clinical Case: 2/14/2011

- ENMT
  - Episodes of episcleritis, not with each episode of rash.
- Systemic
  - Daily fatigue, no fevers, weight stable.
- Investigations
  - GI w/u negative for celiac, Whipple's, inflam bowel disorders.
  - ESR and CRP frequently elevated during the rash.
  - Borderline elevated ANA once, recent positive anti thyroid peroxidase ab, but immune testing otherwise negative.
- Family history
  - Negative for similar symptoms and any other Rheumatologic disorders.
- Treatment
  - Corticosteroids relieve fatigue but did not affect the rash.

MAYO CLINIC

Clinical Case: 2/14/2011

- Examination
  - Normal.
  - Cell phone pictures of skin confirm patchy erythema.
- Laboratory
  - Hgb 10.8 g/dl, WBC 12,800, Plt normal,
  - ESR 99 mm/hr, CRP 218.4 mg/L
  - CMP, muscle enzymes, urine normal.
  - Mild polyclonal hypergammaglob. with no monoclonal proteins
  - HCV, HBV, Lyme disease testing negative
- Immunologic tests
  - RF, anti CCP, ANA, ENA, ANCA panel negative.
  - C4, C1E Inh, cryos normal. C3 mildly elevated at 181 mg/dl.
  - IBD, celiac antibodies negative.
  - Anti TPO abs very high at 825.7 units (<9 units normal).

MAYO CLINIC

Clinical Case 2/14/2011

- Genetic testing (GeneDx)
  - MEFV gene for Familial Mediterranean Fever.
    No mutation known to be associated with FMF was identified.
  - TNFRSF1A gene for TNF-Receptor Associated Periodic Fever Syndrome (TRAPS).
    - An autosomal dominant disorder.
    - This individual is heterozygous for a C>T nucleotide substitution in exon 3 (T50M mutation).This mutation has been reported previously in association with TRAPS (McDermott 1999, Absentijovich 2001) and its presence is consistent with this diagnosis in this patient. The analytic method used is expected to be 99% sensitive for mutations identifiable by sequencing.
- Minimal improvement on etanercept (Enbrel).
- Improved results with anakinra (Kineret).

MAYO CLINIC

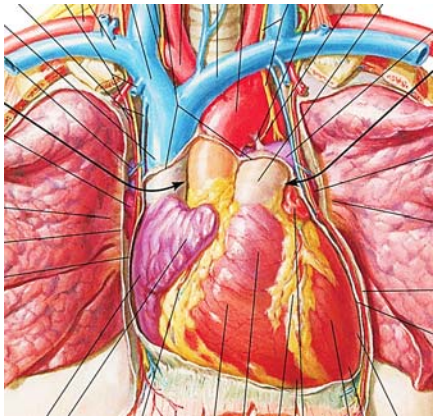
Idiopathic Recurrent Acute Pericarditis



Pericardium

IRAP Treatment with Colchicine

Prevention of Recurrent Pericarditis With Colchicine in 2012

Gal Markel, MD, PhD; Massimo Imazio, MD; Antonio Brucato, MD; Yehuda Adler, MD

Clin. Cardiol. 36, 3, 125–128 (2013)

- Colchicine + aspirin compared to aspirin alone
  - 50% reduction in recurrent pericarditis compared to aspirin alone.
  - Previous or concurrent corticosteroids reduced efficacy of colchicine.

IRAP: An Autoinflammatory Disorder?

Autoimmunity and autoinflammation as the yin and yang of idiopathic recurrent acute pericarditis

Luca Cantarini [a,*,1], Giuseppe Lopalco [b,1], Carlo Selmi [c,d], Salvatore Napodano [e], Gabriella De Rosa [e], Francesco Caso [a,f], Luisa Costa [g], Florenzo Iannone [b], Donato Rigante [e]

Autoimmunity Reviews 14 (2015) 90–97

- Turkish patients with FMF
  - 1.4% develop pericarditis
- Italian patients with IRAP
  - 0% with FMF gene mutation
  - 6% with TRAPS gene mutation.

MAYO CLINIC

IRAP Secondary to TRAPS

Clues to detect tumor necrosis factor receptor-associated periodic syndrome (TRAPS) among patients with idiopathic recurrent acute pericarditis: results of a multicentre study

Luca Cantarini • Orso Maria Lucherini • Antonio Brucato • Luca Barone • Davide Cumetti •

Clin Res Cardiol (2012) 101:525–531

- TNFRSF1A gene mutations can be detected in about 6% with recurrent pericarditis.
- positive family history for pericarditis and/or recurrent fever syndrome.
- recurrences/year after the first year from the index attack of acute pericarditis
- colchicine failure
- need of immunosuppressive agents

MAYO CLINIC

IRAP Treatment with Anakinra

Successful treatment of adult patients with idiopathic recurrent pericarditis with an interleukin-1 receptor antagonist (anakinra)

Dimitrios Vassilopoulos [a], George Lazaros [b,*], Costas Tsioufis [b], Panagiotis Vasileiou [b], Christodoulos Stefanadis [b], Dimitrios Pectasides [a]

International Journal of Cardiology 160 (2012) 66–77

- Three patients with treatment resistant IRAP
- All three responded to anakinra given over several months.
  - One relapsed off QD anakinra and responded to QOD reinstitution.
  - One relapsed off QD anakinra but responded to NSAIDs and colchicine.
  - One did not relapse 15 months after discontinuing anakinra

MAYO CLINIC

Periodic Fever Disorders

Summary

- Elevated IL-1 is a common cause of fever.
- Elevated circulating IL-1 largely explains the fever and other inflammatory manifestations of gout, IRAP and periodic fever disorders such as FMF and TRAPS.
- Spontaneous excess production of IL-1 by the NLRP3/Cryopyrin inflammasome explains the fevers in periodic fever disorders.
- Effective IL-1 antagonists are available.
- Genetic testing may be helpful in identifying patients with periodic fever disorders.
