In patients with intermediate- or poor-risk aRCC\textsuperscript{1} WHEN LOOKING FOR A CHANCE FOR LONG-TERM DURABLE SURVIVAL\textsuperscript{2}

OPDIVO, in combination with YERVOY\textsuperscript{6}, is indicated for the first-line treatment of patients with intermediate- or poor-risk advanced renal cell carcinoma (aRCC).\textsuperscript{1}

Now with 4-year follow-up data\textsuperscript{2}

**Checkmate 214**

**In Checkmate 214 (OPDIVO + YERVOY):**

**Primary analysis results (median follow-up time of 25.2 months)**\textsuperscript{1,5}

- Median OS was not reached for OPDIVO + YERVOY (95% CI: 28.2-NE) vs 25.9 months for sunitinib (95% CI: 22.1-NE);
- HR=0.63 (99.8% CI: 0.44–0.89); \(P<0.0001\textsuperscript{1,5}\)

**Extended follow-up analysis results (minimum follow-up time of 48 months) for OPDIVO + YERVOY\textsuperscript{2}

- The 48-month OS rate for OPDIVO + YERVOY was 50.0% vs 35.8% for sunitinib. Median OS was 48.1 months (95% CI: 35.6–NE) for OPDIVO + YERVOY vs 26.6 months for sunitinib (95% CI: 22.1–33.5); HR=0.65 (95% CI: 0.54–0.78)\textsuperscript{2}

* vs sunitinib in the ITT population.\textsuperscript{1}

\textsuperscript{1}Based on primary analysis results at a median follow-up of 18.1 months (range: 10.6–30.6 months).\textsuperscript{1}

\textsuperscript{2}BICR assessed.\textsuperscript{1}

\textsuperscript{†} Based on primary analysis results at a median follow-up of 18.1 months (range: 10.6–30.6 months).\textsuperscript{1}

\textsuperscript{‡} BICR assessed.\textsuperscript{1}

\textsuperscript{§} BICR-assessed.\textsuperscript{1}

\textsuperscript{1}L=first line; BICR=blinded independent central review; CI=confidence interval; HR=hazard ratio; I-O=immuno-oncology; ITT=intent to treat; NE=not evaluable; OS=overall survival; PFS=progression-free survival; TKI=tyrosine kinase inhibitor.

**SELECT IMPORTANT SAFETY INFORMATION**

**Summary of Warnings and Precautions**

- OPDIVO and YERVOY are associated with the following Warnings and Precautions: severe and fatal immune-mediated reactions including pneumonitis, colitis, hepatitis and hepatotoxicity, endocrinopathies, nephritis with renal dysfunction, dermatologic adverse reactions, other immune-mediated adverse reactions; infusion-related reactions; complications of allogeneic hematopoietic stem cell transplantation (HSCT); embryo-fetal toxicity; and increased mortality in patients with multiple myeloma when OPDIVO is added to a thalidomide analogue and dexamethasone, which is not recommended outside of controlled clinical trials.

Please see additional Important Safety Information for OPDIVO and OPDIVO + YERVOY on pages 12–13 and US Full Prescribing Information for OPDIVO and YERVOY.

Please see page 2 for more information about the Checkmate 214 study design and endpoints and page 8 for more information about the Checkmate 9ER study design and endpoints.

For aRCC patients who may benefit from an I-O + TKI therapy\textsuperscript{1} THE ONLY APPROVED I-O + TKI COMBINATION TO DOUBLE MEDIAN PFS\textsuperscript{1,3}††

OPDIVO, in combination with CABOMETYX\textsuperscript{8}, is indicated for the first-line treatment of patients with advanced renal cell carcinoma (aRCC).\textsuperscript{1}

Now with ~2-year follow-up data\textsuperscript{4}

**Checkmate 9ER**

**In Checkmate 9ER (OPDIVO + CABOMETYX):**

**Primary analysis results (median follow-up time of 18.1 months; range: 10.6–30.6 months)**\textsuperscript{3,3}

- The median PFS\textsuperscript{3} for OPDIVO + CABOMETYX was 16.6 months (95% CI: 12.5–24.9) vs 8.3 months (95% CI: 7.0–9.7) for sunitinib; HR=0.51 (95% CI: 0.41–0.64); \(P<0.0001\textsuperscript{1}\)
In the 1L treatment of patients with intermediate- or poor-risk advanced renal cell carcinoma

Checkmate 214 study information

- Checkmate 214 was a phase 3, randomized (1:1), open-label study of OPDIVO 3 mg/kg IV and YERVOY 1 mg/kg IV (n=425) every 3 weeks for four doses, followed by OPDIVO 3 mg/kg IV every 2 weeks vs sunitinib (n=422) 50 mg administered orally once daily for four weeks, followed by 2 weeks off every cycle, in patients with previously untreated intermediate-/poor-risk aRCC. Patients were stratified by IMDC prognostic score and region, and treatment was continued until disease progression or unacceptable toxicity. The co-primary endpoints in IMDC intermediate-/poor-risk patients were OS, ORR, and PFS.

Primary analysis results (median follow-up time of 25.2 months)

- Median OS was not reached for OPDIVO + YERVOY (95% CI: 28.2–NE) vs 25.9 months for sunitinib (95% CI: 22.1–NE); HR=0.63 (99.8% Cl: 0.44–0.89); P<0.0001.
- Confirmed ORR was 41.6% (177/425 [95% Cl: 36.9–46.5]); CR: 9.4% [n=40]; PR: 32.2% [n=137]) for OPDIVO + YERVOY vs 26.5% (112/422 [95% Cl: 22.4–31.0]; CR: 1.2% [n=5]; PR: 25.4% [n=107]) for sunitinib (P<0.0001).
- Among responders, median duration of response was not yet reached (95% Cl: 21.8–NE) for OPDIVO + YERVOY and 18.2 months (95% Cl: 14.8–NE) for sunitinib.
- Median progression-free survival for OPDIVO + YERVOY was 11.6 months (95% Cl: 8.7–15.5) vs 8.4 months (95% Cl: 7.0–10.8) for sunitinib; HR=0.82 (99.9% Cl: 0.64–1.05); P=0.0015.

Extended follow-up analysis results (minimum follow-up time of 48 months)

- The 48-month OS rate for OPDIVO + YERVOY was 50.0% vs 35.8% for sunitinib. mOS was 48.1 months (95% CI: 35.6–NE) for OPDIVO + YERVOY vs 26.6 months for sunitinib (95% Cl: 22.1–33.5); HR=0.65 (95% Cl: 0.54–0.78).
- OPDIVO + YERVOY: ORR: 41.9% (n=178/425 [95% Cl: 37–47]; CR: 10.4% [n=44/425]; PR: 31.5% [n=134/425]); sunitinib: ORR: 26.8% (n=113/422 [95% Cl: 23–31]; CR: 1.4% [n=6/422]; PR: 25.4% [n=107/422]).
- Among responders, median DOR in the follow-up analysis at a minimum of 48 months is not yet reached for OPDIVO + YERVOY (95% Cl: 45.8–NE) vs 19.7 months for sunitinib (95% Cl: 15.4–25.0); HR=0.45 (95% Cl: 0.31–0.65).

### SELECT IMPORTANT SAFETY INFORMATION

Severe and Fatal Immune-Mediated Adverse Reactions

- Immune-mediated adverse reactions listed herein may not include all possible severe and fatal immune-mediated adverse reactions.
- Immune-mediated adverse reactions, which may be severe or fatal, can occur in any organ system or tissue. While immune-mediated adverse reactions usually manifest during treatment, they can also occur after discontinuation of OPDIVO or YERVOY. Early identification and management are essential to ensure safe use of OPDIVO and YERVOY. Monitor for signs and symptoms that may be clinical manifestations of underlying immune-mediated adverse reactions. Evaluate clinical chemistry including liver enzymes, creatinine, adrenocorticotropic hormone (ACTH) level, and thyroid function at baseline and periodically during treatment with OPDIVO and before each dose of YERVOY. In cases of suspected immune-mediated adverse reactions, initiate appropriate workup to exclude alternative etiologies, including infection. Institute medical management promptly, including specialty consultation as appropriate.
- Withhold or permanently discontinue OPDIVO and YERVOY depending on severity (please see section 2 Dosage and Administration in the accompanying Full Prescribing Information). In general, if OPDIVO or YERVOY interruption or discontinuation is required, administer systemic corticosteroid therapy (1 to 2 mg/kg/day prednisone or equivalent) until improvement to Grade 1 or less. Upon improvement to Grade 1 or less, initiate corticosteroid taper and continue to taper over at least 1 month. Consider administration of other systemic immunosuppressants in patients whose immune-mediated adverse reactions are not controlled with corticosteroid therapy. Toxicity management guidelines for adverse reactions that do not necessarily require systemic steroids (e.g., endocrinopathies and dermatologic reactions) are discussed below.

Progression-free survival: OPDIVO + YERVOY demonstrated median PFS† of 11.6 months (95% CI: 8.7–15.5) vs 8.4 months (95% CI: 7.0–10.8) for sunitinib (HR=0.82, 99.1% CI: 0.64–1.05)1,5

- Per pre-specified analysis, PFS did not meet statistical significance1,5

What are your safety expectations for I-O + TKI therapy?

Grade 3–5 adverse reactions were similar with OPDIVO® (nivolumab) + CABOMETYX® (cabozantinib) vs sunitinib (75% vs 71%)3

---

**SELECT IMPORTANT SAFETY INFORMATION**

### Serious Adverse Reactions
- In Checkmate 9ER, serious adverse reactions occurred in 48% of patients receiving OPDIVO and cabozantinib (n=320). The most frequent serious adverse reactions reported in ≥2% of patients were diarrhea, pneumonia, pneumonitis, pulmonary embolism, urinary tract infection, and hyponatremia. Fatal intestinal perforations occurred in 3 (0.9%) patients.

### Common Adverse Reactions
- In Checkmate 9ER, the most common adverse reactions (≥20%) in patients receiving OPDIVO and cabozantinib (n=320) were diarrhea (64%), fatigue (51%), hepatotoxicity (44%), palmar-plantar erythrodysesthesia syndrome (40%), stomatitis (37%), rash (36%), hypertension (36%), hypothyroidism (34%), musculoskeletal pain (33%), decreased appetite (28%), nausea (27%), dysgeusia (24%), abdominal pain (22%), cough (20%) and upper respiratory tract infection (20%).

Please see additional Important Safety Information for OPDIVO on pages 12–13 and US Full Prescribing Information for OPDIVO.
When choosing I-O + TKI therapy in aRCC

OPDIVO® (nivolumab) + CABOMETYX® (cabozantinib):
Superior efficacy across 3 endpoints vs sunitinib from the combination of 2 proven agents 

OPDIVO + CABOMETYX is indicated for the first-line treatment of advanced renal cell carcinoma, across all IMDC risk categories 

**PRIMARY ANALYSIS**

**Superior efficacy across 3 key endpoints**

- **ORR**: 55.7% (n=180/323 [95% CI: 50.1–61.2]) with OPDIVO + CABOMETYX vs 27.1% (n=89/328 [95% CI: 22.4–32.3]) with sunitinib (P<0.0001)
  - 8% (n=26/323) CR and 47.7% (n=154/323) PR for OPDIVO + CABOMETYX vs 4.6% (n=15/328) CR and 22.6% (n=74/328) PR for sunitinib
- **Double median PFS vs sunitinib (primary endpoint)**
  - Median PFS: 16.6 months (95% CI: 12.5–24.9) with OPDIVO + CABOMETYX vs 8.3 months (95% CI: 7.0–9.7) with sunitinib (HR=0.51; 95% CI: 0.41–0.64; P<0.0001)
- **Significant OS benefit vs sunitinib with ~18-month median follow-up**
  - Median OS: NR (95% CI: NR) with OPDIVO + CABOMETYX and NR (95% CI: 22.6–NR) with sunitinib (HR=0.60; 98.89% CI: 0.40–0.89; P=0.0010)

**Safety data you may not have expected**

- Rate of Grade 3–5 adverse reactions was 75% with OPDIVO + CABOMETYX and 71% with sunitinib
- Rate of discontinuation due to adverse reactions was 19.7% (6.6% OPDIVO alone; 7.5% CABOMETYX alone; 5.6% both drugs due to same adverse reaction occurring at the same time)

**Combine 2 established clinical legacies**

- Well-studied individual agents with 5 aRCC registrational trials (either monotherapy or in combination)

**SELECT IMPORTANT SAFETY INFORMATION**

**Serious Adverse Reactions**

- In Checkmate 9ER, serious adverse reactions occurred in 48% of patients receiving OPDIVO and cabozantinib (n=320). The most frequent serious adverse reactions reported in ≥2% of patients were diarrhea, pneumonia, pneumonitis, pulmonary embolism, urinary tract infection, and hyponatremia. Fatal intestinal perforations occurred in 3 (0.9%) patients.

**Common Adverse Reactions**

- In Checkmate 9ER, the most common adverse reactions (≥20%) in patients receiving OPDIVO and cabozantinib (n=320) were diarrhea (64%), fatigue (51%), hepatotoxicity (44%), palmar-plantar erythrodysesthesia syndrome (40%), stomatitis (37%), rash (36%), hypertension (36%), hypothyroidism (34%), musculoskeletal pain (33%), decreased appetite (28%), nausea (27%), dysgeusia (24%), abdominal pain (22%), cough (20%) and upper respiratory tract infection (20%).

Please see additional Important Safety Information for OPDIVO on pages 12–13 and US Full Prescribing Information for OPDIVO.
INDICATIONS

OPDIVO® (nivolumab), in combination with YERVOY® (ipilimumab), is indicated for the first-line treatment of patients with intermediate or poor risk advanced renal cell carcinoma (RCC).

OPDIVO, in combination with cabozantinib, is indicated for the first-line treatment of patients with advanced renal cell carcinoma (RCC).

OPDIVO is indicated for the treatment of patients with advanced renal cell carcinoma (RCC) who have received prior anti-angioinogenic therapy.

IMPORTANT SAFETY INFORMATION

Severe and Fatal Immune-Mediated Adverse Reactions

- Immune-mediated adverse reactions listed herein may not include all possible severe and fatal immune-mediated adverse reactions.
- Immune-mediated adverse reactions, which may be severe or fatal, can occur in any organ system or tissue. While immune-mediated adverse reactions usually manifest during treatment, they can also occur after discontinuation of OPDIVO or YERVOY. Early identification and management are essential to ensure safe use of OPDIVO and YERVOY. Monitor for signs and symptoms that may be clinical manifestations of underlying immune-mediated adverse reactions. Evaluate clinical chemistries including liver enzymes, creatinine, adrenocorticotropic hormone (ACTH) level, and thyroid function at baseline and periodically during treatment with OPDIVO and before each dose of YERVOY. In cases of suspected immune-mediated adverse reactions, initiate appropriate workup to exclude alternative etiologies, including infection. Institute medical management promptly, including specialty consultation as appropriate.

- Withhold or permanently discontinue OPDIVO and YERVOY depending on severity (please see section 2 Dosage and Administration in the accompanying Full Prescribing Information). In general, if OPDIVO or YERVOY interruption or discontinuation is required, administer systemic corticosteroid therapy (1 to 2 mg/kg/day prednisone or equivalent) until improvement to Grade 1 or less. Upon improvement to Grade 1 or less, initiate corticosteroid taper and continue to taper over at least 1 month. Consider administration of other systemic immunosuppressants in patients whose immune-mediated adverse reactions are not controlled with corticosteroid therapy. Toxicity management guidelines for adverse reactions that do not necessarily require systemic steroids (e.g. endocrinopathies and dermatologic reactions) are discussed below.

Immune-Mediated Pneumonitis

- OPDIVO and YERVOY can cause immune-mediated pneumonitis. The incidence of pneumonitis is higher in patients who have received prior thoracic radiation. In patients receiving OPDIVO monotherapy, immune-mediated pneumonitis occurred in 3.1% (61/1994) of patients, including Grade 4 (<0.1%), Grade 3 (0.9%), and Grade 2 (2.1%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, immune-mediated pneumonitis occurred in 3.9% (26/666) of patients, including Grade 3 (1.4%) and Grade 2 (2.6%).

Immune-Mediated Colitis

- OPDIVO and YERVOY can cause immune-mediated colitis, which may be fatal. A common symptom included in the definition of colitis was diarrhea. Cytomegalovirus (CMV) infection/reactivation has been reported in patients with corticosteroid-refractory immune-mediated colitis. In cases of corticosteroid-refractory colitis, consider repeating infectious workup to exclude alternative etiologies. In patients receiving OPDIVO monotherapy, immune-mediated colitis occurred in 2.9% (58/1994) of patients, including Grade 3 (1.7%) and Grade 2 (1%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, immune-mediated colitis occurred in 9% (60/666) of patients, including Grade 3 (4.4%) and Grade 2 (3.7%).

Immune-Mediated Hepatitis and Hepatotoxicity

- OPDIVO and YERVOY can cause immune-mediated hepatitis. In patients receiving OPDIVO monotherapy, immune-mediated hepatitis occurred in 1.8% (35/1994) of patients, including Grade 4 (0.2%), Grade 3 (1.3%), and Grade 2 (0.4%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, immune-mediated hepatitis occurred in 7% (48/666) of patients, including Grade 4 (1.2%), Grade 3 (4.9%), and Grade 2 (0.4%).

- OPDIVO in combination with cabozantinib can cause hepatic toxicity with higher frequencies of Grade 3 and 4 ALT and AST elevations compared to OPDIVO alone. Consider more frequent monitoring of liver enzymes as compared to when the drugs are administered as single agents. In patients receiving OPDIVO and cabozantinib, Grades 3 and 4 increased ALT or AST were seen in 11% of patients.

Immune-Mediated Endocrinopathies

- OPDIVO and YERVOY can cause primary or secondary adrenal insufficiency, immune-mediated hypophysitis, immune-mediated thyroid disorders, and Type 1 diabetes mellitus, which can present with diabetic ketoacidosis. Withhold OPDIVO and YERVOY depending on severity (please see section 2 Dosage and Administration in the accompanying Full Prescribing Information). For Grade 2 or higher adrenal insufficiency, initiate symptomatic treatment, including hormone replacement as clinically indicated. Hypophysitis can present with acute symptoms associated with mass effect such as headache, photophobia, or visual field defects. Hypophysitis can cause hypopituitarism; initiate hormone replacement as clinically indicated. Thyroiditis can present with or without endocrinopathy. Hypothyroidism can follow hyperthyroidism; initiate hormone replacement or medical management as clinically indicated. Monitor patients for hyperglycemia or other signs and symptoms of diabetes; initiate treatment with insulin as clinically indicated.

- In patients receiving OPDIVO monotherapy, adrenal insufficiency occurred in 1% (20/1994), including Grade 3 (0.4%) and Grade 2 (0.6%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, adrenal insufficiency occurred in 7% (48/666) of patients, including Grade 4 (0.3%), Grade 3 (2.5%), and Grade 2 (4.1%). In patients receiving OPDIVO and cabozantinib, adrenal insufficiency occurred in 4.7% (15/320) of patients, including Grade 3 (2.2%) and Grade 1 (9.9%).

- In patients receiving OPDIVO monotherapy, hypophysitis occurred in 0.6% (12/1994) of patients, including Grade 3 (0.2%) and Grade 2 (0.3%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, hypophysitis occurred in 4.4% (29/666) of patients, including Grade 4 (0.3%), Grade 3 (2.4%), and Grade 2 (0.9%).

- In patients receiving OPDIVO monotherapy, thyroiditis occurred in 0.6% (12/1994) of patients, including Grade 2 (0.2%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, thyroiditis occurred in 2.7% (22/666) of patients, including Grade 3 (0.4%) and Grade 2 (2.2%).

- In patients receiving OPDIVO monotherapy, hyperthyroidism occurred in 2.7% (54/1994) of patients, including Grade 3 (<0.1%) and Grade 2 (1.2%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, hyperthyroidism occurred in 12% (80/666) of patients, including Grade 3 (0.6%) and Grade 2 (4.5%).

- In patients receiving OPDIVO monotherapy, hypothyroidism occurred in 8% (163/1994) of patients, including Grade 3 (0.2%) and Grade 2 (4.8%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, hypothyroidism occurred in 18% (122/666) of patients, including Grade 3 (0.6%) and Grade 2 (11%).

Immune-Mediated Nephritis with Renal Dysfunction

- OPDIVO and YERVOY can cause immune-mediated nephritis. In patients receiving OPDIVO monotherapy, immune-mediated nephritis and renal dysfunction occurred in 1.2% (23/1994) of patients, including Grade 4 (<0.1%), Grade 3 (0.5%), and Grade 2 (0.6%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, immune-mediated nephritis with renal dysfunction occurred in 4.1% (27/666) of patients, including Grade 4 (0.6%), Grade 3 (1.1%), and Grade 2 (2.2%).

Immune-Mediated Dermatologic Adverse Reactions

- OPDIVO can cause immune-mediated rash or dermatitis. Exfoliative dermatitis, including Stevens-Johnson syndrome (SJS), toxic epidermal necrolysis (TEN), and drug rash with eosinophilia and systemic symptoms (DRESS) has occurred with PD-1/PD-L1 blocking antibodies. Topical emollients and/or topical corticosteroids may be adequate to treat mild to moderate nonexfoliative rashes.

- YERVOY can cause immune-mediated rash or dermatitis, including bullous and exfoliative dermatitis, SJS, TEN, and DRESS. Topical emollients and/or topical corticosteroids may be adequate to treat mild to moderate non-bullous/exfoliative rashes.

- Withhold or permanently discontinue OPDIVO and YERVOY depending on severity (please see section 2 Dosage and Administration in the accompanying Full Prescribing Information).

- In patients receiving OPDIVO monotherapy, immune-mediated rash occurred in 9% (171/1994) of patients, including Grade 3 (1.1%) and Grade 2 (2.2%). In patients receiving OPDIVO 3 mg/kg with YERVOY 1 mg/kg every 3 weeks, immune-mediated rash occurred in 16% (108/666) of patients, including Grade 3 (3.5%) and Grade 2 (4.2%).

Please see US Full Prescribing Information for OPDIVO and YERVOY.
IMPORTANT SAFETY INFORMATION (cont’d)

Severe and Fatal Immune-Mediated Adverse Reactions (cont’d)

Based on its mechanism of action and findings from animal studies, OPDIVO and YERVOY can cause fetal harm when administered to a pregnant woman. The effects of OPDIVO are likely to be greater during the second and third trimesters of pregnancy. Advise pregnant women of the potential risk to a fetus. Advise females of reproductive potential to use effective contraception during treatment with OPDIVO and YERVOY and for at least 5 months after the last dose.

Lactation

There are no data on the presence of OPDIVO or YERVOY in human milk, the effects on the breastfed child, or the effects on milk production. Because of the potential for serious adverse reactions in breastfed children, advise women not to breastfeed during treatment and for 5 months after the last dose.

Serious Adverse Reactions

In Checkmate 214, serious adverse reactions occurred in 59% of patients receiving OPDIVO plus YERVOY (n=547). The most frequent serious adverse reactions reported in ≥2% of patients were diarrhea, pyrexia, pneumonia, pneumonitis, hypophysitis, acute kidney injury, dyspnea, adrenal insufficiency, and colitis. In Checkmate 9ER, serious adverse reactions occurred in 48% of patients receiving OPDIVO and cabozantinib (n=320). The most frequent serious adverse reactions reported in ≥2% of patients were diarrhea, pneumonia, pneumonitis, pulmonary embolism, urinary tract infection, and hyponatremia. Fatal intestinal perforations occurred in 3 (0.9%) patients. In Checkmate 025, serious adverse reactions occurred in 47% of patients receiving OPDIVO (n=406). The most frequent serious adverse reactions reported in ≥2% of patients were acute kidney injury, pleural effusion, pneumonia, diarrhea, and hypercalcemia.

Common Adverse Reactions

In Checkmate 214, the most common adverse reactions (≥20%) reported in patients treated with OPDIVO plus YERVOY (n=547) were fatigue (58%), rash (39%), diarrhea (38%), musculoskeletal pain (37%), pruritus (33%), nausea (30%), cough (28%), pyrexia (25%), arthralgia (23%), decreased appetite (21%), dyspnea (20%), and vomiting (20%). In Checkmate 9ER, the most common adverse reactions (≥20%) in patients receiving OPDIVO and cabozantinib (n=320) were diarrea (64%), fatigue (51%), hepatotoxicity (44%), palmar-plantar erythrodysesthesia syndrome (40%), stomatitis (37%), rash (36%), hypertension (36%), hypophysitis (34%), musculoskeletal pain (33%), decreased appetite (28%), nausea (27%), dysgeusia (24%), abdominal pain (22%), cough (20%), and upper respiratory tract infection (20%). In Checkmate 025, the most common adverse reactions (≥20%) reported in patients receiving OPDIVO (n=406) vs everolimus (n=397) were fatigue (56% vs 57%), cough (34% vs 38%), nausea (28% vs 29%), rash (28% vs 36%), dyspnea (27% vs 31%), diarrhea (25% vs 32%), constipation (23% vs 18%), decreased appetite (23% vs 30%), back pain (21% vs 16%), and arthralgia (20% vs 14%).

Please see US Full Prescribing Information for OPDIVO and YERVOY.
